

VA Master FAM540

Metal Cone Variable Area Flowmeter

Measurement made easy

For measuring liquids, gases and steam

Graphical 2-line LCD display

Magnet stick operation

- Configuration also possible with closed housing

Easily adjustable for new operating conditions

Approvals for explosion protection

- ATEX
- IECEx
- FM, CSA

VA Master FAM540

Metal Cone Variable Area Flowmeter

Overview

Model	FAM541	FAM544	FAM545	FAM546
	Standard design  G10448	Hygienic design  G10449	With PTFE liner  G10450	With heating jacket  G10451
Measured error in accordance with VDE / VDI 3513	1.6 % qg = 50 %	1.6 % qg = 50 %	2.5 % qg = 50 %	1.6 % qg = 50 %
Reproducibility	0.25 % of measured value	0.25 % of measured value	0.25 % of measured value	0.25 % of measured value
Process connection	Flange in accordance with DIN, ASME, JIS, female thread	Thread DIN 11851, SMS 1145	Flange in accordance with DIN, ASME, JIS	Flange in accordance with DIN, ASME, JIS
Nominal connection diameters	DN 15 (1/2") ... DN 100 (4")	DN 25 (1") ... DN 100 (4")	DN 25 (1") ... DN 100 (4")	DN 25 (1") ... DN 100 (4")
Maximum measuring medium temperature	400 °C (752 °F)	140 °C (284 °F)	120 °C (248 °F)	400 °C (752 °F)
Maximum pressure rating	PN 400 / class 2500	PN 40	PN 40 / class 300	PN 100 / class 600
Wetted material	Stainless steel 1.4404 (316L), 1.4571 (316Ti)	Stainless steel 1.4404 (316L), 1.4571 (316Ti)	PTFE	Stainless steel 1.4404 (316L), 1.4571 (316Ti)
Housing material	Stainless steel 1.4404 (316L), 1.4571 (316Ti)	Stainless steel 1.4404 (316L)	Stainless steel 1.4571 (316Ti)	Stainless steel 1.4404 (316L), 1.4571 (316Ti)
Gasket material	Viton A (DN 15 only)	Viton A (DN 25 only)	PTFE	Viton A (DN 25 only)

Indicator / transmitter	
IP degree of protection in accordance with EN 60529	IP 66, IP 67, NEMA 4X
Mechanical indicator	Analog indicator with or without alarm signaling unit
Electronic indicator	Analog indicator with transmitter 4 ... 20 mA, with or without LCD indicator
Communication	HART protocol (only for analog indicators with transmitters)
Power supply	Without alarm signaling unit: no power supply Analog indicator with alarm signaling unit: 8 V DC via switch amplifier Analog indicator with transmitter: 10 ... 46 V DC (Ex: 10 ... 30 V DC)
Indicator housing material	Al Si 12 material number 3.2582 (copper content 0.1 %), stainless steel 1.4408
Paint	Epoxy paint 80 ... 100 µm; Bottom color: RAL 7012, cover color: RAL 9002 (No housing paint for stainless steel indicator housing)

Approvals	
Ex-approvals	ATEX / IECEx: Zone 0 / 1 / 2 / 21 FM / cCSAus: XP, IS, DIP, NI, FM Zone 1 + 2
Sealing concept	Dual sealing in accordance with ANSI / ISA-12.27.01
SIL approval (not for FAM545)	Analog indicator with alarm signaling unit: SIL 2 Analog indicator with transmitter: FMEDA evaluation

Introduction and basics

Installation conditions

- The installation recommendations of VDI / VDE Directive 3513 must be observed.
- The flowmeter is installed vertically in the piping. The measuring media must flow from bottom to top.
- Keep the device as far as possible from pipe vibrations and powerful magnetic fields.
- The piping should be the same size as the connection size of the flowmeter.
- Inlet and outlet sections are generally not required. Care should be taken to avoid flow turbulence, pulsations, pressure shocks and other flow instabilities in order to prevent measuring inaccuracies, increased wear or damage.
- When selecting devices, pay close attention to the chemical resistance of the wetted parts of the device and the process connection gaskets in relation to the measuring medium.
- Avoid pulsating flow of the measuring medium. Use the optional float damping if necessary.
- For gaseous measuring media we recommend an undisturbed inlet length of five times the inside diameter of the piping in accordance with VDI / VDE Directive 3513 sheet 3. Additional measures such as flow straighteners or perforated plates may be necessary for highly unbalanced flow profiles.
- Avoid contamination of gaseous measuring media (refer to BGR 132-7.3.2.2.2).
- For liquid measuring media, the nominal size of the piping should be dimensioned as large as possible (if economically viable).
- Avoid gas inclusions in liquid measuring media.
- Use slow opening valves.
- If the flowmeter is installed in a pipeline where decommissioning is impossible or inexpedient, a bypass line should be provided.
- Shut-off and throttle valves should preferably be attached to the outlet of the flowmeter.

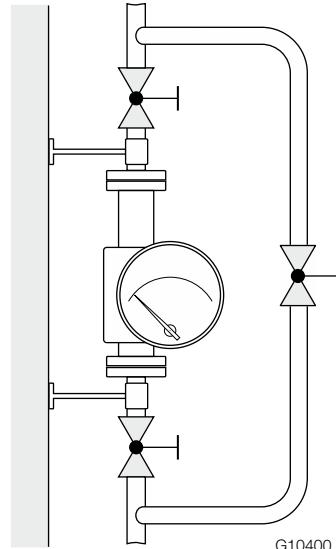

Fig. 1: Installation of the flowmeter (example)

Refer to VDI/VDE Directive 3513 sheet 3, Selection and Installation Recommendations for Variable Area Flowmeters.

Sensor insulation

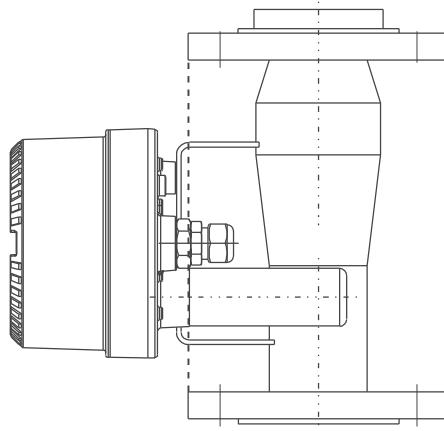

Fig. 2: Insulation of the flowmeter

As shown in Fig. 2, the flowmeter may only be insulated up to the flange diameter.

VA Master FAM540

Metal Cone Variable Area Flowmeter

Operating conditions

A variable area flowmeter is specified for a defined set of operating conditions of the measuring medium. For liquids and gases, these are pressure and temperature-related properties (density and viscosity) under operating conditions. For gases, in particular, this means operating at a specific operating pressure and operating temperature. The specified accuracy of the device always refers to the operating conditions underlying the specification.

Temperature data

The following diagram shows the maximum permissible measuring medium temperature depending on the ambient temperature.

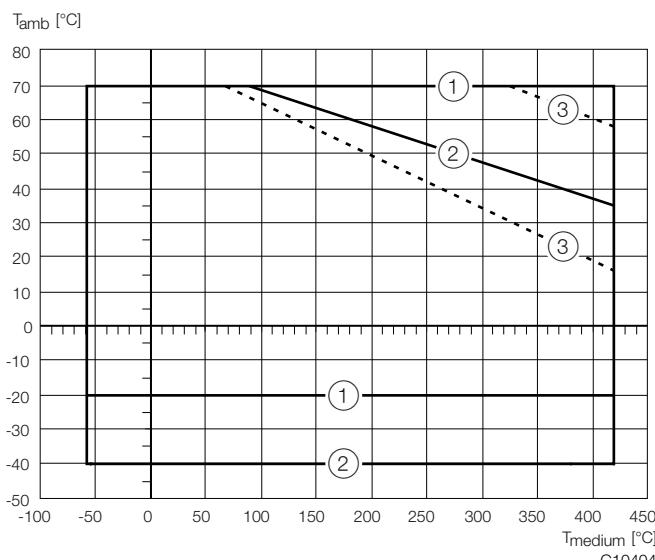

Fig. 3: Medium temperature (T_{medium}), ambient temperature (T_{amb})
① Devices with alarm output -20 ... 70 °C (-4 ... 158 °F)
② Devices with current output -40 ... 70 °C (-40 ... 158 °F)
③ With insulation

NOTE

When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from „Safety specifications ATEX / IECEx“ on page 34 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 43!

Pressure loss

The available operating pressure at the measuring point must be higher than the pressure loss listed for the flowmeter in the specifications.

It is important to also consider the pressure loss downstream from the flowmeter due to losses in the piping and other fittings.

Prevention of compression oscillations when measuring gases

With low flow amounts and low operating pressure, so-called compression oscillations of the float can occur.

If the maximum upstream pressure listed in the specifications is not reached, the flowmeter can optionally be equipped with a gas damper.

To prevent self-generated compression oscillations, note the following information from VDI / VDE 3513 Sheet 3:

- Select a flowmeter with the lowest possible pressure loss.
- Minimize the piping length between the flowmeter and the closest up or downstream throttling location.
- Restrict the usual measuring range from the usual 10 ... 100 % to 25 ... 100 %.
- When setting the flow rate value, always start assuming larger values.
- Increase the operating pressure and consider its effect on the flow rate values due to the change in gas density at the new operating conditions.
- Minimize non-throttled, free volumes upstream and downstream of the device.

Pressure shocks

Especially when measuring gases, it is possible that pressure or shock waves can occur when fast opening solenoid valves are employed and the piping cross-sections are not throttled, or if there are gas bubbles in liquids.

As a result of the sudden expansion of the gas in the piping, the float is forcibly driven against the upper floatstop.

Under certain conditions, this can lead to destruction of the device.

Gas damping is not suited to compensating for pressure shocks!

Solids content in the measuring medium

Variable area flowmeters have only limited suitability for measuring media containing solids.

Depending on the concentration, particle size and type of solid, increased mechanical abrasion may occur, especially at the critical measuring edge of the float.

In addition, solidified deposits on the float can change its weight and shape.

These effects can lead to erroneous measurement results, depending on the float type.

In general, the use of appropriate filters is recommended in such applications.

For the flow measurement of measuring media containing magnetic particles, we recommend the installation of a magnetic separator upstream of the variable area flowmeter.

Float designs

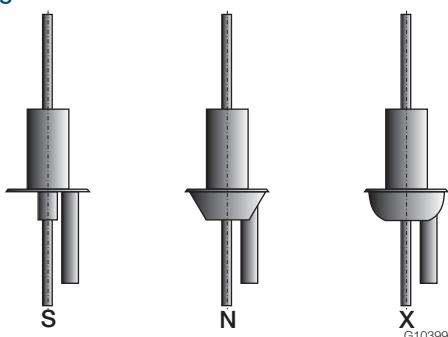

Fig. 4: Float designs

Float "S":

Basic shape of float.

Low flow rates, minimal pressure losses, essentially independent of viscosity; lower upstream pressure required for gas measurement.

Float "N":

Higher flow ranges, average pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

Float "X":

Highest flow rates, maximum pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

Measuring range limits

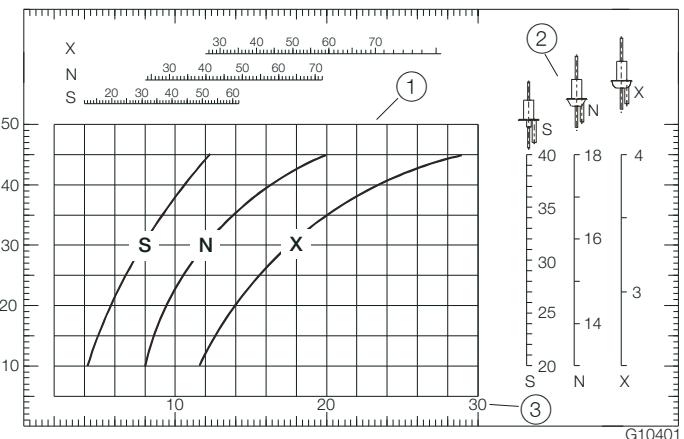

Fig. 5: Flow rate depending on float shape and weight (example)
 (1) Pressure loss (dP in mbar) (2) Diameter of the float weight (mm)
 (3) $\times 1000 \text{ l/h}$ water

For measuring range limits depending on nominal size and float type, refer to the measuring range tables.

Calculating the viscosity influence number (VIN)

The floats are designed geometrically so as to be independent of viscosity within broad limits. This means that the measuring medium viscosity can vary within these limits without resulting in a change of scale.

The viscosity influence number (VIN) is given in the device measuring range tables.

- If the calculated VIN is greater than the listed VIN, viscosity has no influence on the measurements.
- If the calculated VIN is greater than the listed viscosity, the flowmeters are equipped from the factory with a scale adjusted to the viscosity.

$$VUZ = \eta \cdot \sqrt{\frac{(\rho_{s-1}) \cdot 1}{(\rho_{s1} - \rho_1) \cdot \rho_1}}$$

Legend

η	Dynamic viscosity of the measuring medium [mPa s]
ρ_s	Density of the float in accordance with the selection in the measuring range table ($r = 8.02 \text{ g/cm}^3$)
ρ_{s1}	Density of the float being used
ρ_1	Density of the measuring medium

VA Master FAM540

Metal Cone Variable Area Flowmeter

Indicator and transmitter

A magnet in the float translates the height of the float as a measurement for the flow to the decouple-proof magnet follower system of the flowmeter, which is directly connected to the indicator pin.

For analog indicators, the flow value is shown by the indicator on the scale. For indicators with a two-wire transmitter, the indicator position is additionally measured directly at the axis. A standard eddy-current brake is used to dampen indicator vibrations and ensure outstanding readability.

The indicator/transmitter unit is attached to the flowmeter with 2 screws in a reproducible manner. To facilitate installation, the indicator can be removed. A name plate on the flowmeter bracket allows you to assign a unique identifier at a later date.

Analog indicator with or without alarm signaling unit

The analog indicators are available with or without an alarm signaling unit. The alarm signaling units are housed on an alarm module that can also be retrofitted. It is available as a single (min. or max. alarm) or dual (min. or max. alarm) alarm module.

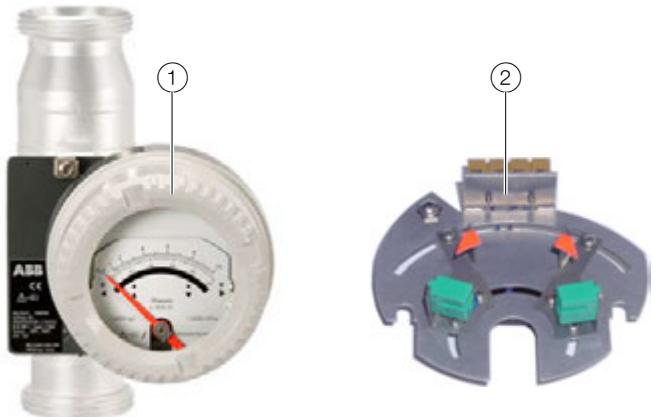

Fig. 6: Analog indicator

① Analog indicator ② Alarm module (option)

G10452

Product highlights

- Decouple-proof and hysteresis-free magnet follower system.
- The device conforms to NAMUR Recommendations NE43, NE53, NE107.
- Installing and uninstalling the analog indicator on the meter tube is possible without opening the indicator housing.
- Reading repeatability: $\pm 0.25\%$ of scale end value.
- The alarm signaling unit can be retrofitted as an alarm module.
- The switching points of the alarm signaling units are adjustable without removing the scale.
- The set switching points of the alarm signaling units are visible from the exterior.

Alarm signaling unit

Additional switching amplifiers are needed to operate the alarm signaling units.

See chapter „Ordering Information“ on page 50 for further information.

Alarm signaling unit specifications

Operating mode	bistable
Reproducibility	$\pm 0.5\%$ of scale end value
Nominal voltage	8 V DC (R _i approx. 1 k Ω)
Operating voltage	5 ... 25 V DC
Switching frequency, max.	3 kHz

Switching amplifier

For analog indicators with alarm signaling units
(model FAM54xB/C/Dx)

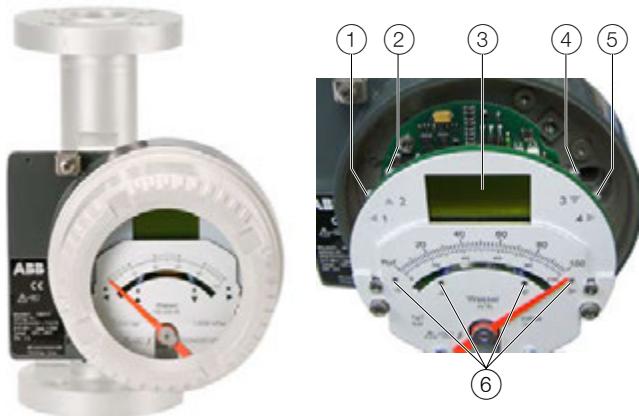

Specifications

Power supply	230 V AC, +10 % / -15 %, 45 ... 60 Hz 115 V AC, +10 % / -15 %, 45 ... 60 Hz 24 V DC, +10 % / -15 %
Output	1 or 2 switching relays with potential-free changeover contacts
Switching capacity	Maximum 250 V, maximum 4 A, maximum 500 VA
Maximum permissible cable length	Between switch amplifier and alarm signaling unit: 300 m (984 ft)
Permissible ambient temperature	-20 ... 60 °C (-4 ... 140 °F)
Electrical connection	Screw terminals, maximum 2.5 mm ² (14 AWG)
Type of assembly	35 mm top-hat rail in accordance with EN 60715:2001
IP rating	IP20 in accordance with EN 60529
Weight	Approx. 150 g (0.3 lb)

Analog indicator with transmitter

The electronic transmitter uses two-wire technology. An optional LCD indicator offers the possibility of adjusting on-site to changed measuring medium parameters.

For models with an LCD indicator, ABB recommends that you use a bar graph scale to avoid differences between a product scale and the flow rate shown on the LCD indicator.

G10453
Fig. 7: LCD indicator with operating buttons and magnet stick markings

- (1) ◀ button (2) ▲ button (3) LCD indicator (4) ▼ button
- (5) ► button (6) Dots for magnet stick operation

Product highlights

- 4 ... 20 mA current output.
- Current output for an alarm can be configured to 21 ... 23 mA (NAMUR NE43).
- Programmable binary output (min. / max. device alarm, general alarm or pulse output).
- Parameterization using HART communication via handheld terminal or DSV401 (SMART VISION).
- Damping: 1 ... 100 s configurable (5τ).
- Low flow cut-off: 0 ... 5 % for current and pulse output.
- Measuring medium parameters can be changed at any time (pressure and temperature influence, density, units, etc.).
- Simulation of current and binary output (manual process execution).
- EEPROM storage of counter readings and parameters specific to the measuring point (over 10 years).
- LCD indicator can be retrofitted.

LCD indicators

- High-contrast LCD indicator.
- Flow rate and flow totalizer value display.
- Plain text fault diagnostics
- Menu-guided parameterization with four buttons.
- Parameterization of the device using a magnet stick without opening the housing.

Legend

U _B	Operating voltage
U _S	Input terminal voltage
R _B	Maximum permissible load for power supply unit (e.g. indicator)
R	Maximum permissible load for output circuit; is determined by power supply unit
	Functional earth

Cables

Maximum cable length 1500 m, AWG 24 twisted and shielded.

Power supply / current output

Terminals 31 / 32 serve both as a connection for the power supply and as a 4 ... 20 mA current output for the transmitter. The current output is also used for HART communication.

Power supply

Terminals	31 / 32
Voltage	Standard: 10 ... 46 V DC
	Explosion-proof design: 10 ... 30 V DC.
Residual ripple	Maximum 5 % or $\pm 1.5 V_{ss}$
Power consumption	< 1 W

Current output

Terminals	31 / 32
Output	4 ... 20 mA, can be configured to 21 ... 23 mA for an alarm (in accordance with NAMUR NE43)
Load	Minimum > 250 Ω , maximum 1500 Ω (for I at alarm = 23.0 mA)
Temperature effect	$\leq 8 \mu A/K$
Power consumption	< 1 W

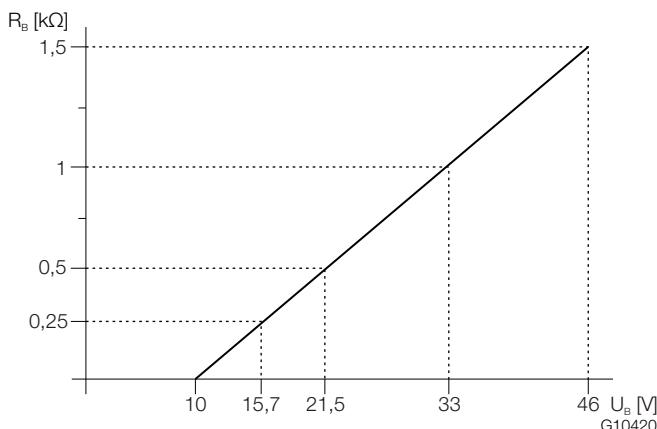

Fig. 10: Load diagram of the current output

HART output

Model FAM54xE/Fx

Specifications

Terminals	31 / 32
Configuration	<ul style="list-style-type: none"> — Directly on the device — Using DAT200 Asset Vision Basic software and HART-DTM
Transmission	FSK modulation on current output 4 ... 20 mA in accordance with Bell 202 standard
Baud rate	1200 baud
Display	Logic 1: 1200 Hz Logic 0: 2200 Hz
Maximum signal amplitude	1.2 mA _{ss}
Load (R_B) at current output	250 ... 1500 Ω

See the separate interface description for detailed information.

System integration

In conjunction with the DTM (Device Type Manager) available for the device, the corresponding framework applications in accordance with FDT 0.98 or 1.2 (DAT200 Asset Vision Basic) can be used for communication (configuration, parameterization). Other tool/system integrations (e.g., Emerson AMS/Siemens PCS7) are available on request. The necessary DTMs and additional files can also be downloaded from www.abb.com/flow.

Programmable binary output

Terminals 41 / 42 are used as a primary programmable binary output. The pulse output, general alarm, min./max. alarm and general alarm functions, as well as "no function" can be configured using the software.

Binary output

Terminals	41 / 42
Output	<ul style="list-style-type: none"> — NAMUR contact (DIN 19234) or — Standard optoelectronic coupler ($U_H = 16 \dots 30 V$ DC)
Switching behavior	Configurable as normally closed or normally open contacts
Internal resistance	With contact open > 10 k Ω
Switching current	Maximum 15 mA
Output voltage	Minimum U_s 2 V DC

Pulse output

Terminals	41 / 42
Pulse width	5 ... 256 ms, maximum 50 % of the period
Frequency f_{max}	Maximum 50 Hz

VA Master FAM540

Metal Cone Variable Area Flowmeter

Model FAM541 - Standard design

G10448

Fig. 11: Model FAM541

Scale

Design optionally with percentage scale or product scale.

Gas damping

Option, for preventing compression oscillations in case of gas measurements with low operating pressure.

SIL approval

- SIL2 declaration of conformity for devices with alarm function.
- Manufacturer's declaration (SIL1) in accordance with IEC 61508 / IEC61511 for devices with a current output of 4 ... 20 mA.

Measuring accuracy

1.6 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2, optional 1 % of upper range value.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see chapter „Measuring range table“ on page 12.

Temperature limits °C (°F)

Medium temperature range

- -55 ... 400 °C (-67 ... 752 °F)

Ambient temperature range

- -40 ... 85 °C (-40 ... 185 °F)

NOTE

- When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from 34 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 43!
- Also observe the information in chapter „Temperature data“ on page 4!

Process connections

- Flange in accordance with EN 1092-1 (PN 16, PN 40)
- Flange in accordance with DIN 2501 (PN 63, PN 100)
- Flange with groove in accordance with DIN 2501
- Flange in accordance with ASME B16.5
- G 1" female thread (1/2" meter tube)
- G 1 1/2 "female thread (1" meter tube)

Pressure ratings

- Standard pressure rating: PN 40 (PN 16 for DN 100 [4"'])
- Flange in accordance with DIN / EN: PN 16, PN 40, PN 63, PN 100
- Flange in accordance with ASME: CL 150, CL 300, CL 600

Other designs and pressure ratings are available upon request.

See chapter „Material load“ on page 11.

Maximum permissible operating pressure

64 bar, 100 bar, 160 bar, 250 bar
(CL 600 /CL 900 /CL 1500 / CL 2500)

Materials

Materials for the indicator housing

Component	Material
Indicator housing	Standard: aluminum, powder-coated Option: stainless steel 1.4408
Powder coating	Epoxy paint 80 ... 100 µm Bottom color: RAL 7012 Cover color: RAL 9002
Housing gasket (O-ring)	Buna N®
Sight glass	Shatterproof glass

Materials for wetted parts

Component	Material

1) Connection nominal size

2) The upper range value can be selected anywhere within these limits. The measuring span is 10:1.

Example: upper range value 12 m³/h (USgal/h) water, measuring span of device 1.2 to 12 m³/h (USgal/h) water.

3) Order code for meter tube / float combination (versions 18, 19), see chapter „Main ordering information FAM541“ on page 50.

4) Viscosity influence number (VIN), see chapter „Calculating the viscosity influence number (VIN)“ on page 5.

5) The listed pressure loss values are based on the listed upper range value.

6) The minimum required pressure (abs) to prevent compression oscillations (float bounce) in the meter tube. The specifications for the minimum required pressures with and without damping are based on average installation conditions. Some installations may have higher values (high free volume upstream / downstream of the device).

7) Cylinder / piston damping. For nominal diameters DN 15 ... DN 80 (1/2 ... 3").

8) These meter tube / float combinations always require gas piston damping for gas measurements.

VA Master FAM540

Metal Cone Variable Area Flowmeter

Model FAM544 - hygienic design

Fig. 15: Model FAM544 in hygienic design

This model has been specially constructed with threaded connections in accordance with DIN 11851 to meet the more stringent hygienic requirements of the food and beverage industry in respect of biological cleaning.

All parts of the flowmeter that come into contact with the measuring medium are welded and polished. There are no gaps or other empty areas. The device is suitable for cleaning or sterilization with steam, acids and alkali. The device is also CIP-cleanable.

Scale

Design optionally with percentage scale or product scale.

Gas damping

Not available.

SIL approval

- SIL2 declaration of conformity for devices with alarm function.
- Manufacturer's declaration (SIL1) in accordance with IEC 61508 / IEC61511 for devices with a current output of 4 ... 20 mA.

Measuring accuracy

1.6 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2, optional 1 % of upper range value.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see chapter „Measuring range table“ on page 18.

Temperature limits °C (°F)

Medium temperature range

- -55 ... 400 °C (-67 ... 752 °F)

Ambient temperature range

- -40 ... 85 °C (-40 ... 185 °F)

NOTE

- When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from 34 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 43!
- Also observe the information in chapter „Temperature data“ on page 4!

Process connections

- Threaded spud in accordance with DIN 11851 (SC 25 ... SC 80)
- Threaded spud in accordance with SMS 1145 (DN 38 ... DN 102)

Connection dimensions

Nominal Diameter	Meter tube size	SMS 1145	DIN 11851
DN 25	1/2"	SC 25	–
DN 40	1"	SC 40	DN 38
DN 50	2"	SC 50	DN 51
DN 80	3"	SC 80	DN 76
DN 100	4"	–	DN 102
DN 125	4"	SC 125	–

Pressure ratings

Threaded spuds in accordance with DIN 11851:

- PN 25 for DN 50 ... DN 80 (2 ... 3")
- PN 40 for DN 25 ... DN 40 (1 ... 1 1/2")
- PN 16 for DN 125 (5")

Threaded spud in accordance with DIN 1145:

- PN 6 for (DN 38 ... DN 102)

See chapter „Material load“ on page 17.

Maximum permissible operating pressure

See chapter „Material load“ on page 17.

Materials

Materials for the indicator housing

Component	Material
Indicator housing	Standard: aluminum, powder-coated Option: stainless steel 1.4408
Powder coating	Epoxy paint 80 ... 100 µm Bottom color: RAL 7012 Cover color: RAL 9002
Housing gasket (O-ring)	Buna N®
Sight glass	Shatterproof glass

Material load

Process connection	Nominal Diameter	PS _{max}	TS _{min}	TS _{max}
DIN 11851	DN 15 ... 40 (1/2 ... 1 1/2")	40 bar (580 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 50 ... 100 (2 ... 4")	25 bar (362 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 125 (5")	16 bar (232 psi)	-40 °C (-40 °F)	140 °C (284 °F)
SMS 1145	DN 38 ... 102 (1 1/2 ... 4")	6 bar (87 psi)	-40 °C (-40 °F)	140 °C (284 °F)

Materials for wetted parts

Component	Material
Meter tube	Stainless steel 1.4404 (316 L)
Conical meter pipe	Stainless steel 1.4571 (316 Ti), only DN 15 (1/2")
Variable area	Stainless steel 1.4571 (316 Ti)

Metal Cone Variable Area Flowmeter

Measuring range table

NOTE

The "FlowCalc" program, which is available as a free download from www.abb.com/flow, can be used to calculate flow rates, pressure losses, and upstream pressure requirements.

The data listed applies to water at 20 °C (68 °F), 1 kg/dm³ (62.43 lb/ft³), 1 mPas (1 cP) and to air at 0 °C (70 °F), 1013 mbar (14.7 psia).

1) Connection nominal size

2) The upper range value can be selected anywhere within these limits. The measuring span is 10:1.

Example: upper range value 12 m³/h (USgal/h) water, measuring span of device 1.2 to 12 m³/h (USgal/h) water.

3) Order code for meter tube /float combination (versions 18, 19), see chapter „Main ordering information FAM544“ on page 54.

4) Viscosity influence number (VIN), see chapter „Calculating the viscosity influence number (VIN)“ on page 5.

5) The listed pressure loss values are based on the listed flow rate end value.

6) The minimum required pressure (abs) to prevent compression oscillations (float bounce) in the meter tube. The specifications for the minimum required pressures are based on average installation conditions. Some installations may have higher values (high free volume upstream / downstream of the device).

7) Only for threaded spuds in accordance with DIN 11851

8) Only for threaded spuds in accordance with SMS 1145

Metal Cone Variable Area Flowmeter

Model FAM545 - with PTFE liner

Fig. 17: Model FAM545 with PTFE liner

NOTE

If the device is used in potentially explosive atmospheres, a minimum measuring medium conductivity of $> 10^{-8}$ S/m must be guaranteed.

See also chapters „Use in potentially explosive atmospheres according to ATEX and IECEx“ on page 32 and „Dimensions“ on page 25.

Scale

Design optionally with percentage scale or product scale.

Gas damping

Not available.

SIL approval

Not available.

Measuring accuracy

2.5 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see chapter „Measuring range table“ on page 24.

Temperature limits °C (°F)

Medium temperature range

- -20 ... 125 °C (-4 ... 257 °F)

Ambient temperature range

- -40 ... 85 °C (-40 ... 185 °F)

NOTE

For use in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from 34 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 43!

- Also observe the information in chapter „Temperature data“ on page 4!

Process connections

- Flange in accordance with DIN 2501 (DN 25 ... DN 80)
- Flange in accordance with ASME B16.5

Pressure ratings

- Standard pressure rating PN 40
- Flange in accordance with DIN 2501 (DN 40 ... DN 63)
- Flange in accordance with ASME CL 150, CL 300

See chapter „Material load“ on page 23.

Maximum permissible operating pressure

50 bar (CL 300), (higher pressures available upon request).

Materials

Materials for the indicator housing

Component	Material
Indicator housing	Standard: aluminum, powder-coated Option: stainless steel 1.4408
Powder coating	Epoxy paint 80 ... 100 µm Bottom color: RAL 7012 Cover color: RAL 9002
Housing gasket (O-ring)	Buna N®
Sight glass	Shatterproof glass

Materials for wetted parts

Component	Material
Meter tube	Stainless steel 1.4571 (316 Ti)
Conical meter pipe	PTFE
Flange	Stainless steel 1.4571 (316 Ti)
Variable area	PTFE

VA Master FAM540

Metal Cone Variable Area Flowmeter

Model FAM546 - with heating jacket

Fig. 21: Model FAM541

Scale

Design optionally with percentage scale or product scale.

Gas damping

Option, for preventing compression oscillations in case of gas measurements with low operating pressure.

SIL approval

- SIL2 declaration of conformity for devices with alarm function.
- Manufacturer's declaration (SIL1) in accordance with IEC 61508 / IEC61511 for devices with a current output of 4 ... 20 mA.

Measuring accuracy

1.6 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2, optional 1 % of upper range value.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see chapter „Measuring range table“ on page 28.

Temperature limits °C (°F)

Medium temperature range

- -55 ... 400 °C (-67 ... 752 °F)

Ambient temperature range

- -40 ... 85 °C (-40 ... 185 °F)

NOTE

- When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from 34 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 43!
- Also observe the information in chapter „Temperature data“ on page 4!

Process connections

- Flange in accordance with DIN 2501 (DN 50 (2") ... DN 100 (4"))
- Flange in accordance with EN 1092-1 (DN 25 (1"))
- Flange in accordance with ASME B16.5

Heating jacket connection

Female thread G 1/4, at the back of the meter tube.

Pressure ratings

- Standard pressure rating: PN 40 (PN 16 for DN 100 (4"))
- Flange in accordance with DIN / EN: PN 16, PN 40, PN 63, PN 100
- Flange in accordance with ASME: CL 150, CL 300, CL 600
- Heating jacket: PN 16

See chapter „Material load“ on page 27.

Maximum permissible operating pressure

- Meter tube: 100 bar (CL 600).
- Heating jacket: 16 Bar (232 psi)

Higher pressures on request.

1) Connection nominal size

2) The upper range value can be selected anywhere within these limits. The measuring span is 10:1.

Example: upper range value 12 m³/h (USgal/h) water, measuring span of device 1.2 to 12 m³/h (USgal/h) water.

3) Order code for meter tube /float combination (versions 18, 19), see chapter „Main ordering information FAM546“ on page 60.

4) Viscosity influence number (VIN), see chapter „Calculating the viscosity influence number (VIN)“ on page 5.

5) The listed pressure loss values are based on the listed flow rate end value.

6) The minimum required pressure (abs) to prevent compression oscillations (float bounce) in the meter tube. The specifications for the minimum required pressures with and without damping are based on average installation conditions. Some installations may have higher values (high free volume upstream / downstream of the device).

7) Cylinder / piston damping. For nominal diameters DN 15 ... DN 80 (1/2 ... 3").

8) These meter tube/float combinations always require gas piston damping for gas measurements.

VA Master FAM540

Metal Cone Variable Area Flowmeter

Use in potentially explosive atmospheres according to ATEX and IECEx

NOTE

Further information on the approval of devices for use in potentially explosive atmospheres can be found in the type examination certificates or the relevant certificates at www.abb.com/flow.

Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 8.

Zone 1	Zone 2	Standard / No explosion protection	Order code ¹⁾
			B1 (Ex nA) A4 (Ex nA, Ex ia)
			A9 (Ex nA, Ex ia, Ex d)
			G10467

 Potential equalization

1) Order code "Explosion protection and approvals" (versions 9, 10); refer to chapter „Ordering Information“ on page 50.

Ex-marking

NOTE

- Depending on the design, a specific marking in accordance with ATEX or IECEx applies.
- ABB reserves the right to modify the Ex-marking. Refer to the name plate for the exact marking.

Signal cable

The Ex calculations are based on temperatures of 80 °C (176 °F) at the cable input. For this reason, cables with a specification of 80 °C (176 °F) must be used.

For cables limited to 70 °C (158 °F), a maximum ambient temperature of $T_{amb} = 60 °C$ (140 °F) applies.

The resulting new maximum measuring medium temperatures are determined as follows:

- Calculate a new ambient temperature:
 $T_{amb\ new} = T_{amb} + 10 °C$ (18 °F).
- Use the calculated ambient temperature $T_{amb\ new}$ to determine the new associated permissible measuring medium temperatures in the tables.
- Please use the limit value tables with the original ambient temperature T_{amb} to determine the relevant temperature class. See chapter „Safety specifications ATEX / IECEx“ on page 34, Tables 1 through 5.

Example:

- $T_{amb} = 50 °C$ (122 °F) becomes
 $T_{amb\ new} = 60 °C$ (140 °F).
- Determine the measuring medium temperature
 $T_{amb} = 60 °C$ (140 °F).
- Determine the temperature class for
 $T_{amb} = 50 °C$ (122 °F).

Earthing

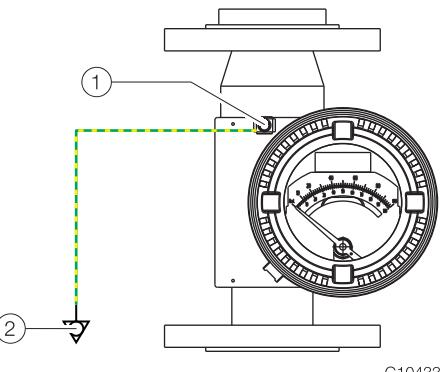

Fig. 27: Earthing
① Earthing terminal
② Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

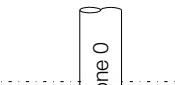

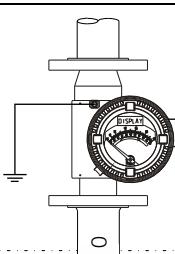

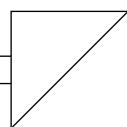

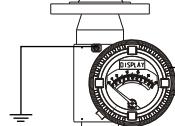

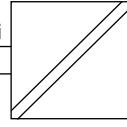

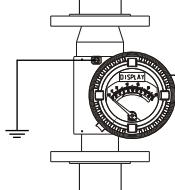

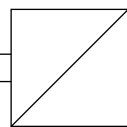

Use in potentially explosive atmospheres in accordance with FM and cCSAus

NOTE

Further information on the approval of devices for use in potentially explosive atmospheres can be found in the type examination certificates or the relevant certificates at www.abb.com/flow.

Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 8.

Terminal	Function
31 / 32	Power supply / current output / HART output
41 / 42	Binary output Alarm signaling unit (min.)
51 / 52	Alarm signaling unit (max.)

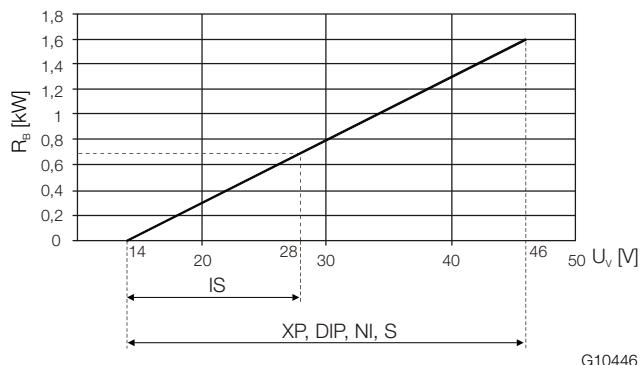

Fig. 29: Terminals 31 / 32, power supply / load

U_V Power supply

R_B Maximum permissible load in the power supply (z. B. indicator)

The minimum voltage $U_V = 0$ V is based on a load of 0Ω .

Installation instructions

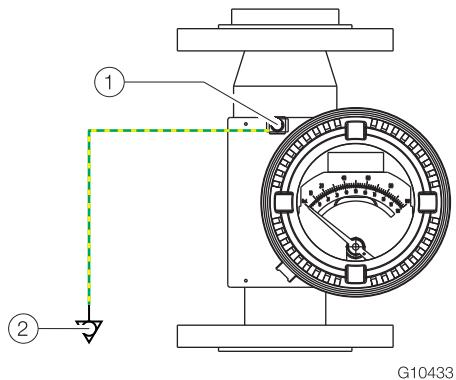

The concept of intrinsic safety enables multiple intrinsic safety devices with FM or CSA approval to be interconnected, without entity parameters being examined specifically, subject to observation of the following conditions:

- U_o or V_{oc} or $V_t \leq 0$ V max., I_o or I_{sc} or $I_t \leq I_{max}$, C_a or $C_o \geq C_i + C_{cable}$, L_a or $L_o \geq L_i + L_{cable}$, $P_o \leq P_i$.
- For installation in Class II and III environments, dust-proof ignition blocks must be used.
- Devices connected to such apparatus must not use or generate rms or direct voltages in excess of 250 V.
- Installation must meet the requirements of ANSI / ISA RP 12.6 "Installation of Intrinsically Safe Systems for Hazardous (Classified) Locations" and the National Electrical Code (ANSI / NFPA 70) sections 504, 505 and CEC.
- The configuration of the associated apparatus must have Factory Mutual Research and CSA approval in accordance with the entity concept.
- Devices must be installed in compliance with the manufacturer-supplied installation drawing of the associated apparatus.
- Changes to drawings are only permitted subject to prior approval from Factory Mutual Research and CSA.
- Only shielded twisted pair cables may be used (see above).

NOTE

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing SDM-10-A0253".

Earthing

G10433

Fig. 30: Earthing

(1) Earthing terminal

(2) Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

Signal cable

For ambient temperatures below 5 °C (41 °F) or above 40 °C (104 °F), signal cables that are suited for the minimum/maximum ambient temperatures in question must be used.

Only use signal cables made from copper, copper-coated aluminum, or aluminum.

The recommended tightening torque for the terminals is 0.8 Nm (7 in. lb) or higher, in accordance with the specification.

Power supply

Installation must comply with the requirements of the National Electric Code® (ANSI / NFPA70).

Unless specified otherwise in regional or national standards, power supply lines must be dimensioned to AWG 20.

Installation must be carried out as outlined in the latest edition of the manufacturer's instruction manual.

A power supply with the following requirements must be used to provide power:

- SELV (safety extra-low voltage) with LPS (current-limited source) and double or reinforced insulation.
- Maximum output current of 8 A (current-limited output).
- In accordance with National Electric Code® (ANSI / NFPA70) connected to NEC class 2.

- 1) Not available with Ex d or XP applications
- 2) Version with analog indicator without output signal: Type of protection "c" only available with ATEX approval
- 3) With Ex d approved cable gland. Not available for analog indicator without output signal
- 4) Only with cable entry 1/2 in. NPT
- 5) Not available with FM / CSA approval, only available in 1 in. and 1-1/2 in. size
- 6) For liquid applications only
- 7) DN 15 ... DN 80 only (1/2 ... 3 in.)
- 8) Not available with DN 40 (1-1/2 in.) and DN 100 (4 in.)
- 9) Not available with DN 40 (1-1/2 in.)
- 10) For Ex devices upon request
- 11) Standard, automatically specified by ABB if not specified by customer
- 12) Recommended for indicator with transmitter 4 ... 20 mA with LCD display
- 13) Not available with analog indicator with alarm

VA Master FAM540

Metal Cone Variable Area Flowmeter

Measurement made easy

Power and productivity
for a better world™

Short product description

Metal Cone Variable Area Flowmeter for measuring the flow rate of the operating volume or mass flow units (at constant pressure / temperature), if a physical mass flow unit is selected.

Device firmware: Version B.20 or higher

1 Safety

1.1 General information and instructions

These instructions are an important part of the product and must be retained for future reference.

Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.

For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer.

The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.

Modifications and repairs to the product may only be performed if expressly permitted by these instructions.

Information and symbols on the product must be observed. These may not be removed and must be fully legible at all times.

The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

1.2 Warnings

The warnings in these instructions are structured as follows:

DANGER

The signal word "DANGER" indicates an imminent danger.

Failure to observe this information will result in death or severe injury.

WARNING

The signal word "WARNING" indicates an imminent danger.

Failure to observe this information may result in death or severe injury.

CAUTION

The signal word "CAUTION" indicates an imminent danger.

Failure to observe this information may result in minor or moderate injury.

NOTE

The signal word "NOTE" indicates useful or important information about the product.

The signal word "NOTE" is not a signal word indicating a danger to personnel. The signal word "NOTE" can also refer to material damage.

1.3 Intended use

This device is intended for the following uses:

- To transmit fluid or gaseous measuring media.
- To measure the flow rate of the operating volume or mass flow units (at constant pressure / temperature), if a physical unit is selected.

The device has been designed for use exclusively within the technical limit values indicated on the identification plate and in the data sheets.

When using media for measurement the following points must be observed:

- Measuring media may only be used if, based on the state of the art or the operating experience of the user, it can be assured that the chemical and physical properties necessary for safe operation of the materials of transmitter components coming into contact with these will not be adversely affected during the operating period.
- Media containing chloride in particular can cause corrosion damage to stainless steels which, although not visible externally, can damage wetted parts beyond repair and lead to the measuring medium escaping. It is the operator's responsibility to check the suitability of these materials for the respective application.
- Measuring media with unknown properties or abrasive measuring media may only be used if the operator can perform regular and suitable tests to ensure the safe condition of the meter.

The operator bears sole responsibility for the use of the devices in relation to suitability, intended use and corrosion resistance of the materials in relation to the measuring medium.

The manufacturer is not liable for damage arising from improper or non-intended use.

Repairs, alterations, and enhancements, or the installation of replacement parts, are only permissible insofar as these are described in this manual. Approval by ABB Automation Products GmbH must be sought for any activities beyond this scope. Repairs performed by ABB-authorized specialist shops are excluded from this.

1.4 Improper use

The following are considered to be instances of improper use of the device:

- For operating as a flexible adapter in piping, e.g. for compensating pipe offsets, pipe vibrations, pipe expansions, etc.
- For use as a climbing aid, e.g. for mounting purposes
- For use as a support for external loads, e.g. as a support for piping, etc.
- Material application, e.g. by painting over the name plate or welding/soldering on parts
- Material removal, e.g. by spot drilling the housing

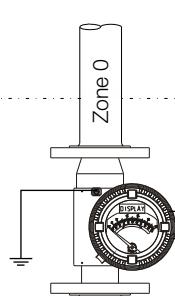

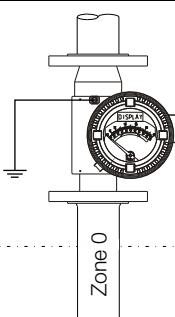

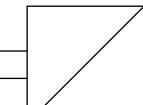

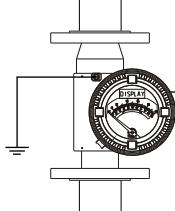

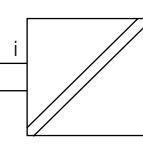

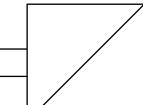

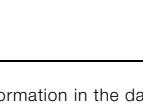

2 Use in potentially explosive atmospheres according to ATEX and IECEx

i NOTE

For further information on the approval of devices for use in potentially explosive atmospheres, refer to the type-examination certificates or the relevant certificates at www.abb.com/flow.

2.1 Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 31.

Zone 1	Zone 2	Standard / No explosion protection	Order code ¹⁾

1) Order code "Explosion protection and approvals" (versions 9, 10); refer to chapter „Ordering information in the data sheet“ on page 36.

2.2 Installation instructions

The installation, commissioning, maintenance and repair of devices in areas with explosion hazard must only be carried out by appropriately trained personnel.

The safety instructions for electrical apparatus in potentially explosive areas must be complied with, in accordance with Directive 94/9/EC (ATEX) and IEC60079-14 (Installation of electrical equipment in potentially explosive areas).

To ensure safe operation, the requirements of EU Directive ATEX 118a (minimum requirements concerning the protection of workers) must be met.

When using in potentially explosive atmospheres, please note:

- Observe the information in chapter „Installation conditions“ on page 27 during installation of the device.
- The maximum ambient temperature for use with combustible dusts (category II 2D) is $T_{amb} = +60^{\circ}\text{C}$.
- When commissioning the flowmeter, refer to EN 60079-0 regarding use in areas with combustible dust.
- For explosion proof apparatus with PTFE liners, a minimum medium conductivity of $> 10^{-8} \text{ S/m}$ must be guaranteed.
- If zone 0 is present in the meter tube, the devices may only be installed in an environment ensuring sufficient ventilation of zone 1.
- Variable area flowmeters used in accordance with maximum electrical values for a category 3 device (zone 2) can also be used without modification as category 2 devices in zone 1 (see chapter „Changing the type of protection“ on page 15).

2.2.1 Protection against electrostatic discharges

DANGER

Risk of explosion!

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

2.2.2 Sensor insulation

The device may be insulated. The maximum permissible thickness of the insulation corresponds to the flange diameter. See chapter „Sensor insulation“ on page 27.

2.2.3 Opening and closing the transmitter housing

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

Before opening the housing cover, remove the cover protector, and reattach it after closing the housing cover. For sealing original spare parts should be used only.

NOTE

Spare parts can be ordered from ABB Service:

Please contact Customer Center Service acc. to page 2 for nearest service location.

2.2.4 Cable entries

The devices are connected electrically using a cable gland or alternatively by using conduit systems with pipe fittings. For this purpose, the devices are delivered with cable glands or alternatively with 1/2" NPT connection threads for pipe fittings.

ATEX / IECEx-approved flameproof cable glands made from metal are supplied with device versions that have type of protection Ex-d "Flameproof enclosure" (order code A9). ATEX / IECEx-approved cable glands made from plastic are supplied with device versions that have type of protection Ex-ia and Ex-nA.

The various connection possibilities depend on the device-specific configuration of the explosion protection and the "Housing material / cable connection" option in accordance with the ordering information in data sheet DS/FAM540.

To ensure proper routing of cables, the following cable diameters are required:

- Ex d design: 7.2 ... 11.7 mm (0.28 ... 0.46 inch)
- Other designs: 5.0 ... 9.0 mm (0.20 ... 0.35 inch)

Devices with 1/2" NPT threads and ATEX and IECEx approvals (except for "Ex d") can be ordered and operated without cable glands. The operator is responsible for properly installing threaded conduit connections in accordance with national regulations (e.g., NEC, CEC, ATEX137, IEC60079-14, etc.).

2.2.5 Type of protection Ex d - flameproof enclosure

Model FAM540, order code A9

The flowmeter is electrically connected via the ATEX / IECEx-approved cable gland with type of protection Ex-d (see Fig. 1) located on the device.

Alternatively, the flowmeter can be connected using conduit systems. In type of protection Ex-d, the connection must be made with an ATEX / IECEx-approved pipe fitting with a flame barrier. The mechanical ignition barrier must be installed directly on the housing.

The preinstalled cable gland must be removed before connecting a pipe fitting. The M25 x 1.5 / 1/2" NPT adapter remains unchanged on the device.

i NOTE

Pipe fittings with flame barriers are not included in the scope of supply.

Only ATEX / IECEx-approved pipe fittings with a flame barrier may be used with type of protection Ex-d. The use of cable and wire entries, pipe fittings or sealing plugs without an Ex-d type examination certificate is prohibited.

Unused openings must be closed with Ex-d-approved sealing plugs.

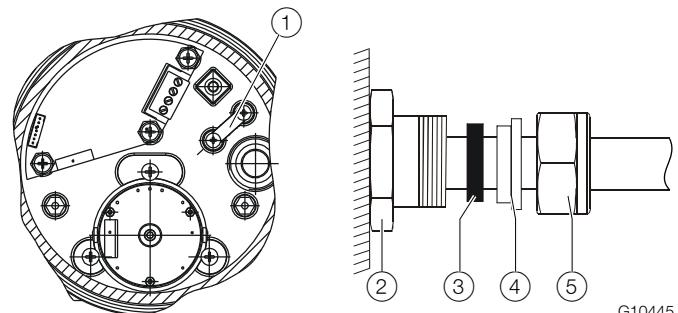

Fig. 1: Connection using a flameproof cable gland
① Strain relief ② M25 x 1.5 / 1/2"-NPT adapter ③ Gasket
④ Sleeve ⑤ Union nut

The outside diameter of the unshielded connection cable must be between 7.2 ... 11.7 mm (0.3 ... 0.5 inch). After installing the cable in the fitting, tighten the union nut using a torque of 3.25 Nm (2.40 lb/in). Use additional strain relief in the housing to secure the connection cable.

2.2.6 Electrical connections

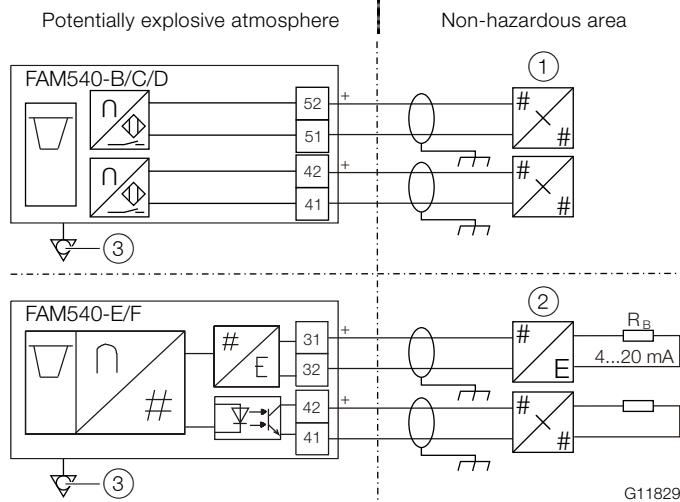

Fig. 2: ATEX / IECEx electrical connection

- (1) NAMUR switching amplifier (2) Safety barrier
- (3) Potential equalization

Terminal	Function
31 / 32	Power supply / current output / HART output
41 / 42	Programmable binary output Alarm signaling unit (min.)
51 / 52	Alarm signaling unit (max.)

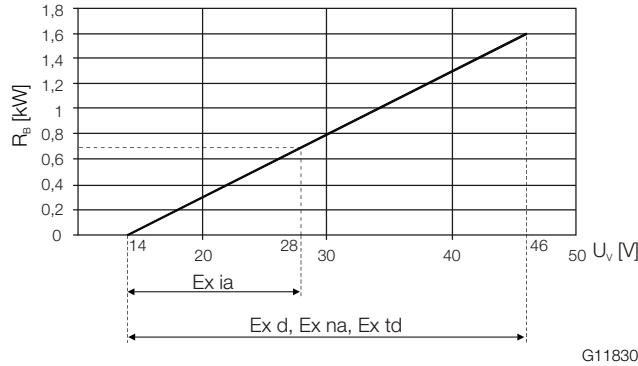

Fig. 3: Terminals 31 / 32, power supply / load

U_V Power supply

R_B Maximum permissible load in the power supply (e.g. indicator)

The minimum voltage $U_V = 0 \text{ V}$ is based on a load of 0Ω .

Signal cable

The Ex calculations are based on temperatures of 80°C (176°F) at the cable input. For this reason, cables with a specification of 80°C (176°F) must be used. For cables limited to 70°C (158°F), a maximum ambient temperature of $T_{\text{amb}} = 60^\circ\text{C}$ (140°F) applies. The resulting new maximum measuring medium temperatures are determined as follows:

- Calculate a new ambient temperature:
 $T_{\text{amb new}} = T_{\text{amb}} + 10^\circ\text{C}$ (18°F).
- Use the calculated ambient temperature $T_{\text{amb new}}$ to determine the new associated permissible measuring medium temperatures in the tables.
- Please use the limit value tables with the original ambient temperature T_{amb} to determine the relevant temperature class. See chapter „Safety specifications ATEX / IECEx“ on page 10, Tables 1 through 5.

Example:

- $T_{\text{amb}} = 50^\circ\text{C}$ (122°F) becomes
 $T_{\text{amb new}} = 60^\circ\text{C}$ (140°F).
- Determine the measuring medium temperature
 $T_{\text{amb}} = 60^\circ\text{C}$ (140°F).
- Determine the temperature class for
 $T_{\text{amb}} = 50^\circ\text{C}$ (122°F).

Earthing

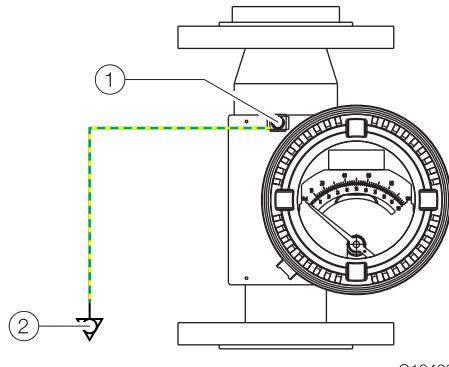

Fig. 4: Earthing

(1) Earthing terminal

(2) Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm^2 (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

2.3 Safety specifications ATEX / IECEx

2.3.1 Special conditions for type of protection "Ex td" (dust explosion protection)

Model FAM54xB/C/D/E/Fx

The following differing temperature data applies to usage in areas with combustible dust.

Order code	Ambient temperature T_{amb}	Maximum permissible measuring medium temperature T_{medium}
A4, A9, B1	-50°C... +60°C	250 °C
	-50°C... +40°C	340 °C
	-50°C... +20°C	430 °C

2.4 Operating instructions**2.4.1 Protection against electrostatic discharges****Risk of explosion!**

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

2.4.2 Changing the type of protection

Depending on the model, the device may be designed to be installed in one of the applications listed. If you plan to use a device that was installed in one type of protection rating in a different type of protection rating, some measures must be taken before connecting voltage to the device.

Measures for devices with alarm signaling unit FAM540-B/C/D:

Original installation	New installation	Necessary test steps
XP or Ex d $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
	NI or Ex nA	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
IS or Ex ia	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.
	NI or Ex nA	No special measures required.
NI or Ex nA $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.

1) Possible only if the maximum signal levels of $U_M \leq 60 \text{ V}$ (e.g., PELV or SELV circuits) were not previously exceeded.

Measures for devices with transmitter with or without LCD display FAM540-E/F.

Original installation	New installation	Necessary test steps
XP or Ex d $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards. — Visual inspection: no explosion, no damage.
	NI or Ex nA	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards. — Visual inspection: no explosion, no damage.
IS or Ex ia	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.
	NI or Ex nA	No special measures required.
NI or Ex nA $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards.
	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.

1) Possible only if the maximum signal levels of $U_M \leq 60 \text{ V}$ (e.g., PELV or SELV circuits) were not previously exceeded.

3 Use in potentially explosive atmospheres in accordance with FM and cCSAus

i NOTE

For further information on the approval of devices for use in potentially explosive atmospheres, refer to the type-examination certificates or the relevant certificates at www.abb.com/flow.

3.1 Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 19.

Class 1 Division 1 / Zone 1	Class 1 Division 2 / Zone 2	Standard / No explosion protection	Order code ¹⁾
			 F4 (NI, IS)
			 F3 (NI, IS, XP) G11831

Potential equalization

1) Order code "Explosion protection and approvals" (versions 9, 10); refer to chapter Ordering information in the data sheet.

3.1.1 Ex-marking

i NOTE

- Depending on the design, a specific marking in accordance with FM applies.
- ABB reserves the right to modify the Ex-marking. Refer to the name plate for the exact marking.

1) Order code "Explosion protection and approvals" (version digit No. 9, 10); refer to chapter „Ordering information in the data sheet“ on page 36.

3.2 Installation instructions

The installation, commissioning, maintenance and repair of devices in areas with explosion hazard must only be carried out by appropriately trained personnel.

The operator must strictly observe the applicable national regulations with regard to installation, function tests, repairs, and maintenance of electrical devices. (e.g. NEC, CEC).

Intrinsic Safety Control Drawing

NOTE

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing".

See chapter "Appendix"

3.2.1 Sensor insulation

The device may be insulated. The maximum permissible thickness of the insulation corresponds to the flange diameter. See chapter „Sensor insulation“ on page 27.

3.2.2 Opening and closing the transmitter housing

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

Before opening the housing cover, remove the cover protector, and reattach it after closing the housing cover. For sealing original spare parts should be used only.

NOTE

Spare parts can be ordered from ABB Service:

Please contact Customer Center Service acc. to page 2 for nearest service location.

3.2.3 Cable entries

Devices with FM and CSA approval are delivered for electrical connection using conduit systems that have 1/2" NPT connection threads and are sealed with dust protection plugs. Alternatively, cable glands with 1/2" NPT thread can be used for the connection. National guidelines (NEC, CEC) must be observed.

For operation with type of protection XP "Explosionproof", the installation instructions in chapter „Type of protection XP "Explosion proof"“ on page 19" must be observed.

3.2.4 Type of protection XP "Explosion proof"

For operation with type of protection XP "Explosion proof", the connection is made using Ex-approved pipe fittings with a flame barrier with type of protection XP.

In Group A and B hazardous areas, the flame barriers must be installed within a distance of 46 cm (18.1 inch) from the device.

When using cable glands for the connection, Ex-approved cable glands with type of protection XP or Ex-d must be used (see Fig. 5).

i NOTE

There must be a separate XP type examination certificate for the pipe fitting.

The use of standard cable and wire entries and sealing plugs is prohibited.

The pipe fitting is not included in the scope of supply.

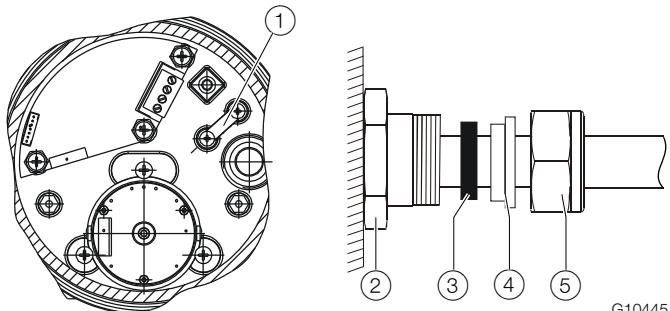

Fig. 5: Connection using a flameproof cable gland

- (1) Strain relief
- (2) M25 x 1.5 / 1/2"-NPT adapter
- (3) Gasket
- (4) Sleeve
- (5) Union nut

The outside diameter of the unshielded connection cable must be between 8.0 ... 11.7 mm (0.3 ... 0.5 inch).

The cable gland must be dimensioned accordingly.

After installing the cable in the gland, tighten the union nut to a torque of 3.25 Nm (2.40 lbf/in).

Use an additional strain relief device in the housing to secure the connection cable.

3.2.5 Electrical connections

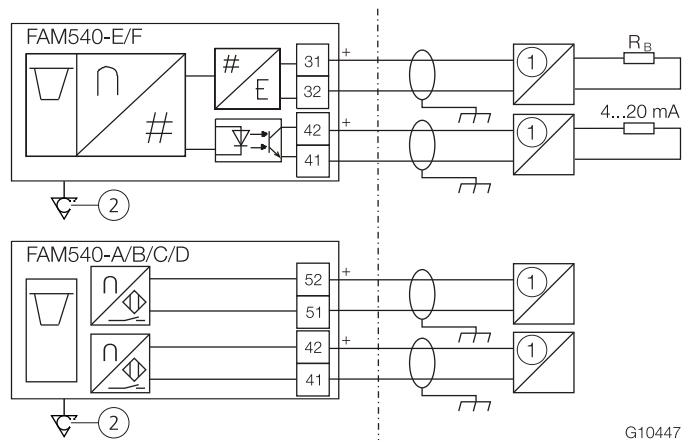

Fig. 6: FM / cCSAus electrical connection
 (1) FM Approved IS Barrier (2) Potential equalization

Terminal	Function
31 / 32	Power supply / current output / HART output

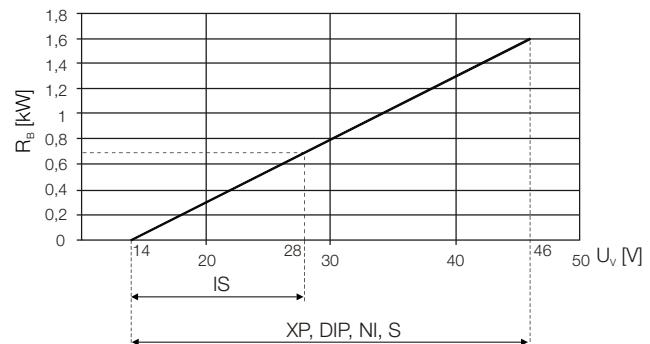

Fig. 7: Terminals 31 / 32, power supply / load
 U_V Power supply
 R_B Maximum permissible load in the power supply (z. B. indicator)

The minimum voltage U_V = 0 V is based on a load of 0 Ω.

Installation instructions

The concept of intrinsic safety enables multiple intrinsic safety devices with FM or CSA approval to be interconnected, without entity parameters being examined specifically, subject to observation of the following conditions:

- $U_o \text{ or } V_{oc} \text{ or } V_t \leq 0 \text{ V max}$, $I_o \text{ or } I_{sc} \text{ or } I_t \leq I_{max}$, $C_a \text{ or } C_o \geq C_i + C_{cable}$, $L_a \text{ or } L_o \geq L_i + L_{cable}$, $P_o \leq P_i$.
- For installation in Class II and III environments, dust-proof ignition blocks must be used.
- Devices connected to such apparatus must not use or generate rms or direct voltages in excess of 250 V.
- Installation must meet the requirements of ANSI / ISA RP 12.6 "Installation of Intrinsically Safe Systems for Hazardous (Classified) Locations" and the National Electrical Code (ANSI / NFPA 70) sections 504, 505 and CEC.
- The configuration of the associated apparatus must have Factory Mutual Research and CSA approval in accordance with the entity concept.
- Devices must be installed in compliance with the manufacturer-supplied installation drawing of the associated apparatus.
- Changes to drawings are only permitted subject to prior approval from Factory Mutual Research and CSA.
- Only shielded twisted pair cables may be used (see above).

i NOTE

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing".

See chapter "Appendix"

Earthing

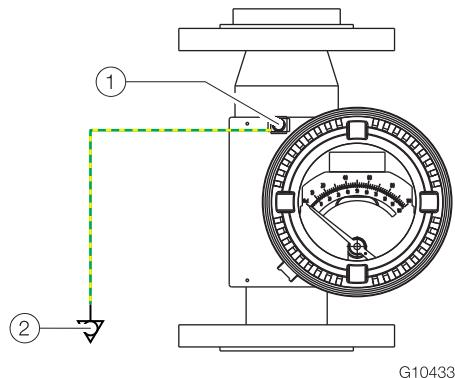

Fig. 8: Earthing

- (1) Earthing terminal
- (2) Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

Signal cable

For ambient temperatures below 5 °C (41 °F) or above 40 °C (104 °F), signal cables that are suited for the minimum/maximum ambient temperatures in question must be used.

Only use signal cables made from copper, copper-coated aluminum, or aluminum.

The recommended tightening torque for the terminals is 0.8 Nm (7 in. lb) or higher, in accordance with the specification.

Power supply

Installation must comply with the requirements of the National Electric Code® (ANSI / NFPA70).

Unless specified otherwise in regional or national standards, power supply lines must be dimensioned to AWG 20.

Installation must be carried out as outlined in the latest edition of the manufacturer's instruction manual.

A power supply with the following requirements must be used to provide power:

- SELV (safety extra-low voltage) with LPS (current-limited source) and double or reinforced insulation.
- Maximum output current of 8 A (current-limited output).
- In accordance with National Electric Code® (ANSI / NFPA70) connected to NEC class 2.

3.4 Operating instructions

3.4.1 Protection against electrostatic discharges

DANGER

Risk of explosion!

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

3.4.2 Changing the type of protection

The device can be operated with various types of protection:

- When connecting to an intrinsically safe circuit in CL 1 Div. 1 or Zone 1, with type of protection "Intrinsic Safety (IS)".
- When connecting to a non-intrinsically safe circuit in CL 1 Div. 1 or Zone 1, with type of protection "Explosion proof (XP)".
- When connecting to a non-intrinsically safe circuit in CL 1 Div. 2 or Zone 2, with type of protection "Non-Incendive (NI)".

Depending on the model, the device may be designed to be installed in one of the applications listed. If you plan to use a device that was installed for one Ex type of protection with a different Ex type of protection, some measures must be taken before connecting voltage to the device.

When changing the type of protection, chapter „ on page 15 must be adhered to.

Special information

Replacing components can affect the device's approval for use in Class I, Div. 1 and Class I, Div. 2.

If the device was not operated with type of protection XP or IS, but with type of protection NI, the device is only suitable for use in Class I, Div. 2, Group A, B, C, D or in non-hazardous areas.

4 Product identification

4.1 Name plate

i NOTE

The power supply, ambient temperature (T_{amb}) and measuring medium temperature T_{medium}) data indicated on the name plate must be complied with during commissioning.

For detailed information on the data indicated on the name plate, see the associated operating instructions (OI).

5 Transport and storage

5.1 Inspection

Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents.

All claims for damages must be submitted to the shipper without delay and before installation.

5.2 Transport

⚠ DANGER

Life-threatening danger due to suspended loads.

In the case of suspended loads, a danger of the load falling exists.

Remaining under suspended loads is prohibited.

When transporting the device, please note:

- The center of gravity of some devices is not at the center of the equipment.
- The protection plates or dust caps mounted at the process connections of devices equipped with PTFE/PFA may only be removed immediately before installation. To prevent possible leakage, ensure that the liner on the flange is not cut or damaged.
- Ensure that small internal parts such as floats or cones do not fall out and become damaged.

5.3 Returning devices

Please contact Customer Center Service acc. to page 2 for nearest service location.

6 Installation

6.1 Installation conditions

- The installation recommendations of VDI / VDE Directive 3513 must be observed.
- The flowmeter is installed vertically in the piping. The measuring media must flow from bottom to top.
- Keep the device as far as possible from pipe vibrations and powerful magnetic fields.
- The piping should be the same size as the connection size of the flowmeter.
- Inlet and outlet sections are generally not required. Care should be taken to avoid flow turbulence, pulsations, pressure shocks and other flow instabilities in order to prevent measuring inaccuracies, increased wear or damage.
- When selecting devices, pay close attention to the chemical resistance of the wetted parts of the device and the process connection gaskets in relation to the measuring medium.
- Avoid pulsating flow of the measuring medium. Use the optional float damping if necessary.
- For gaseous measuring media we recommend an undisturbed inlet length of five times the inside diameter of the piping in accordance with VDI / VDE Directive 3513 sheet 3. Additional measures such as flow straighteners or perforated plates may be necessary for highly unbalanced flow profiles.
- Avoid contamination of gaseous measuring media (refer to BGR 132-7.3.2.2.2).
- For liquid measuring media, the nominal size of the piping should be dimensioned as large as possible (if economically viable).
- Avoid gas inclusions in liquid measuring media.
- Use slow opening valves.
- If the flowmeter is installed in a pipeline where decommissioning is impossible or inexpedient, a bypass line should be provided.
- Shut-off and throttle valves should preferably be attached to the outlet of the flowmeter.

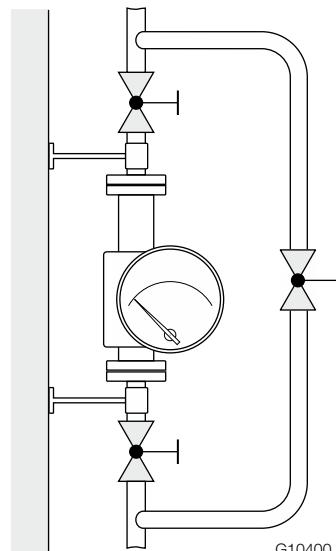

Fig. 9: Installation of the flowmeter (example)

Refer to VDI/VDE Directive 3513 sheet 3, Selection and Installation Recommendations for Variable Area Flowmeters.

6.1.1 Sensor insulation

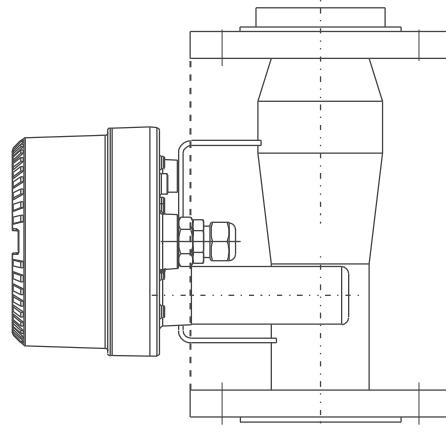

Fig. 10: Insulation of the flowmeter

As shown in Fig. 10, the flowmeter may only be insulated up to the flange diameter.

6.2 Operating conditions

A variable area flowmeter is specified for a defined set of operating conditions of the measuring medium. For liquids and gases, these are pressure and temperature-related properties (density and viscosity) under operating conditions.

For gases, in particular, this means operating at a specific operating pressure and operating temperature. The specified accuracy of the device always refers to the operating conditions underlying the specification.

6.2.1 Temperature data

The following diagram shows the maximum permissible measuring medium temperature depending on the ambient temperature.

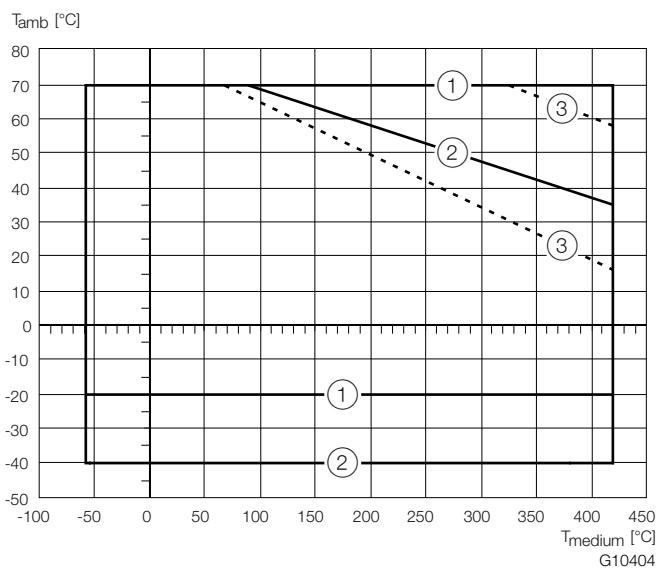

Fig. 11: Medium temperature (T_{medium}), ambient temperature (T_{amb})

- (1) Devices with alarm output -20 ... 70 °C (-4 ... 158 °F)
- (2) Devices with current output -40 ... 70 °C (-40 ... 158 °F)
- (3) With insulation

NOTE

When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from „Safety specifications ATEX / IECEx“ on page 10 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 21!

6.2.2 Pressure loss

The available operating pressure at the measuring point must be higher than the pressure loss listed for the flowmeter in the specifications.

It is important to also consider the pressure loss downstream from the flowmeter due to losses in the piping and other fittings.

6.2.3 Prevention of compression oscillations when measuring gases

With low flow amounts and low operating pressure, so-called compression oscillations of the float can occur.

If the maximum upstream pressure listed in the specifications is not reached, the flowmeter can optionally be equipped with a gas damper.

To prevent self-generated compression oscillations, note the following information from VDI / VDE 3513 Sheet 3:

- Select a flowmeter with the lowest possible pressure loss.
- Minimize the piping length between the flowmeter and the closest up or downstream throttling location.
- Restrict the usual measuring range from the usual 10 ... 100 % to 25 ... 100 %.
- When setting the flow rate value, always start assuming larger values.
- Increase the operating pressure and consider its effect on the flow rate values due to the change in gas density at the new operating conditions.
- Minimize non-throttled, free volumes upstream and downstream of the device.

6.2.4 Pressure shocks

Especially when measuring gases, it is possible that pressure or shock waves can occur when fast opening solenoid valves are employed and the piping cross-sections are not throttled, or if there are gas bubbles in liquids.

As a result of the sudden expansion of the gas in the piping, the float is forcibly driven against the upper floatstop.

Under certain conditions, this can lead to destruction of the device.

Gas damping is not suited to compensating for pressure shocks!

6.2.5 Solids content in the measuring medium

Variable area flowmeters have only limited suitability for measuring media containing solids.

Depending on the concentration, particle size and type of solid, increased mechanical abrasion may occur, especially at the critical measuring edge of the float.

In addition, solidified deposits on the float can change its weight and shape.

These effects can lead to erroneous measurement results, depending on the float type.

In general, the use of appropriate filters is recommended in such applications.

For the flow measurement of measuring media containing magnetic particles, we recommend the installation of a magnetic separator upstream of the variable area flowmeter.

6.3 Float designs

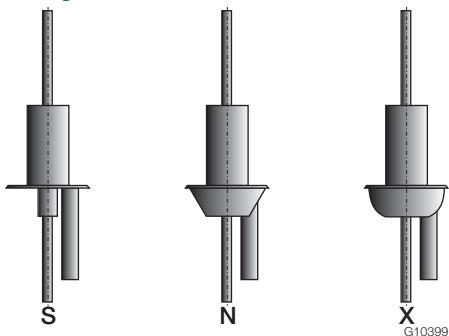

Fig. 12: Float designs

Float "S":

Basic shape of float.

Low flow rates, minimal pressure losses, essentially independent of viscosity; lower upstream pressure required for gas measurement.

Float "N":

Higher flow ranges, average pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

Float "X":

Highest flow rates, maximum pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

6.3.1 Measuring range limits

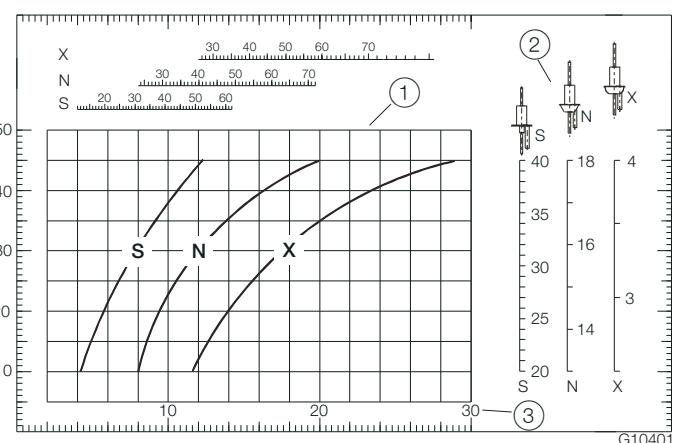

Fig. 13: Flow rate depending on float shape and weight (example)

- ① Pressure loss (dP in mbar)
- ② Diameter of the float weight (mm)
- ③ $\times 1000 \text{ l/h}$ water

For measuring range limits depending on nominal size and float type, refer to the measuring range tables.

6.4 Installation

The following points must be observed during installation:

- The flow direction must correspond to the direction indicated on the device, if labeled.
- The maximum torque must not be exceeded for all flange connections.
- The devices must be installed without mechanical tension (torsion, bending)
- Install flange devices with coplanar counter flanges and only use appropriate gaskets.
- Only gaskets made from a material that is compatible with the measuring medium and the measuring medium temperature may be used.
- Gaskets must not extend into the flow area since possible turbulence could influence device accuracy.
- The piping may not exert any impermissible forces or torques on the device.
- Do not remove the sealing plugs in the cable glands until you are ready to install the electrical cable.
- Make sure the gaskets for the housing cover are seated correctly. Carefully seal the cover. Tighten the cover fittings
- Do not expose the transmitter to direct sunlight; where necessary, provide appropriate sun protection.

6.4.1 Flowmeter installation

i NOTE

Potential damage to the device!

- Vacuum shocks in the piping must be prevented for devices with PTFE liners (FAM545). Vacuum shocks can destroy the device.

The device can be installed at any location in a pipeline under consideration of the installation conditions.

1. Remove protective plates, if present, from above and below the meter tube. Ensure that internal parts such as floats or the conical meter pipe do not fall out and become damaged.
2. Remove the wooden stick serving as a transport securing device from the meter tube.
3. Position the meter tube coplanar and centered between the piping.
4. Install gaskets between the sealing surfaces.

i NOTE

For achieve the best results, ensure the gaskets fit concentrically with the meter tube

5. Use the appropriate screws for the holes.
6. Slightly grease the threaded nuts.
7. Tighten the nuts in a crosswise manner as shown in the figure.

i NOTE

Torques for screws depend on temperature, pressure, screw and gasket materials. The relevant applicable regulations must be taken into consideration.

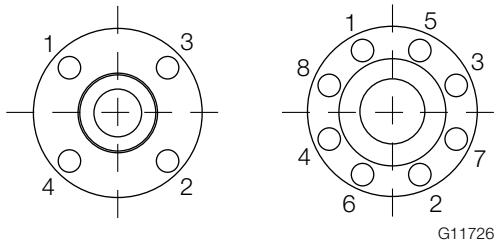

Fig. 14: Tightening sequence for the flange screws

6.4.2 Material loads for process connections

i NOTE

Potential damage to the device!

Exceeding the permissible measuring medium temperature can damage the gaskets and the device.

Do not exceed the maximum permissible measuring medium temperature specified on the factory and name plate as well as in the following tables.

Model FAM541 - Standard design

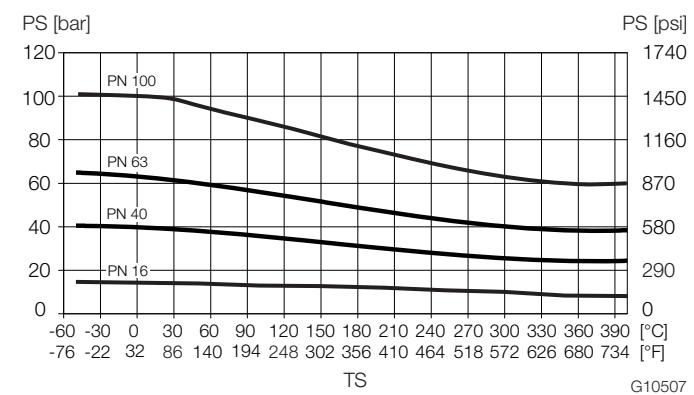

Fig. 15: DIN flange made from stainless steel

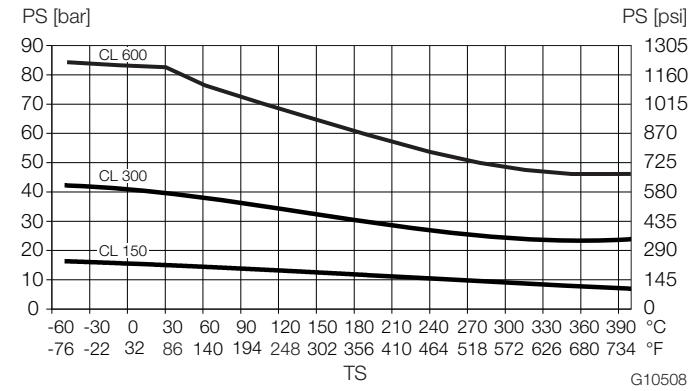

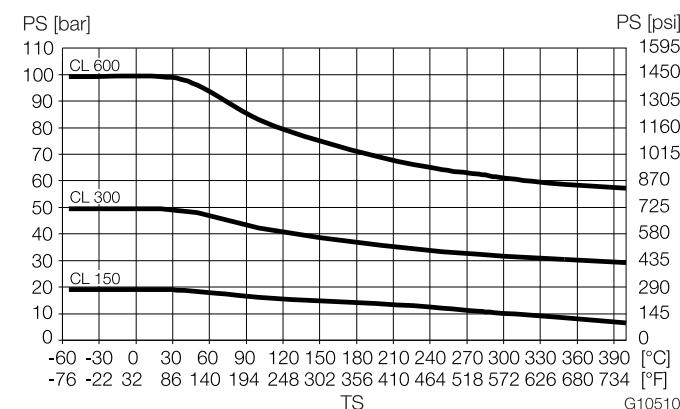

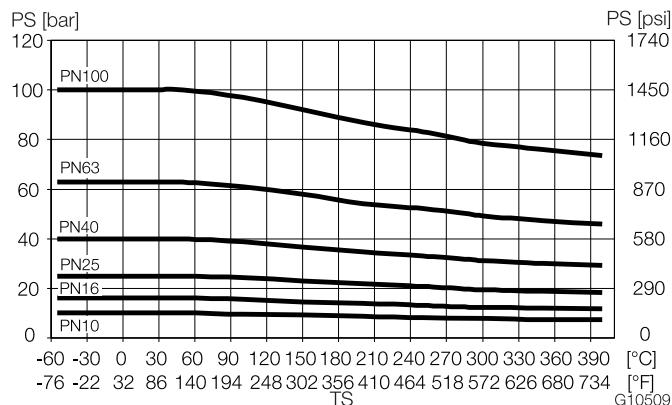

Fig. 16: ASME flange made from stainless steel

Model FAM544 - Hygienic design

Process connection	Nominal Diameter	PS _{max}	TS _{min}	TS _{max}
DIN 11851	DN 15 ... 40 (1/2 ... 1 1/2")	40 bar (580 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 50 ... 100 (2 ... 4")	25 bar (362 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 125 (5")	16 bar (232 psi)	-40 °C (-40 °F)	140 °C (284 °F)
SMS 1145	DN 38 ... 102 (1 1/2 ... 4")	6 bar (87 psi)	-40 °C (-40 °F)	140 °C (284 °F)

Model FAM545 - With PTFE liner and Model FAM546 - With heating jacket

6.5 Electrical connections

DANGER

Improper installation and commissioning of the device carries a risk of explosion.

For use in potentially explosive atmospheres, observe the information in chapter „Use in potentially explosive atmospheres according to ATEX and IECEx“ on page 5 and „Use in potentially explosive atmospheres in accordance with FM and cCSAus“ on page 16!

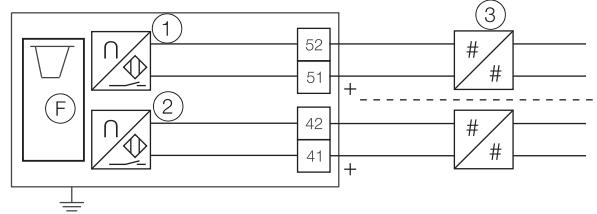

The electrical connection may only be established by authorized specialist personnel and in accordance with the connection diagrams.

The electrical connection information in the manual must be observed; otherwise, the type of electrical protection may be adversely affected.

Ground the measurement system according to requirements.

6.5.1 Analog indicator with alarm signaling unit

Model FAM54xB/C/Dx

G10431

Fig. 19: Alarm signaling unit

- ① Maximum alarm signaling unit
- ② Minimum alarm signaling unit
- ③ Switch amplifier
- F Flowmeter

Additional switching amplifiers are needed to operate the alarm signaling units.

See chapter „Switching amplifier“ on page 32 and the “Ordering information” section of the data sheet for further information.

Alarm signaling unit specifications

Operating mode	bistable
Reproducibility	±0.5% of scale end value
Nominal voltage	8 V DC (R _i approx. 1 kΩ)
Operating voltage	5 ... 25 V DC
Switching frequency, max.	3 kHz

6.5.2 Switching amplifier

For analog indicators with alarm signaling units (model FAM54xB/C/Dx)

Specifications

Power supply	230 V AC, +10 % / -15 %, 45 ... 60 Hz 115 V AC, +10 % / -15 %, 45 ... 60 Hz 24 V DC, +10 % / -15 %
Output	1 or 2 switching relays with potential-free changeover contacts
Switching capacity	Maximum 250 V, maximum 4 A, maximum 500 VA
Maximum permissible cable length	Between switch amplifier and alarm signaling unit: 300 m (984 ft)
Permissible ambient temperature	-20 ... 60 °C (-4 ... 140 °F)
Electrical connection	Screw terminals, maximum 2.5 mm ² (14 AWG)
Type of assembly	35 mm top-hat rail in accordance with EN 60715:2001
IP rating	IP20 in accordance with EN 60529
Weight	Approx. 150 g (0.3 lb)

6.5.3 Analog indicator with transmitter

Model FAM54xE/Fx

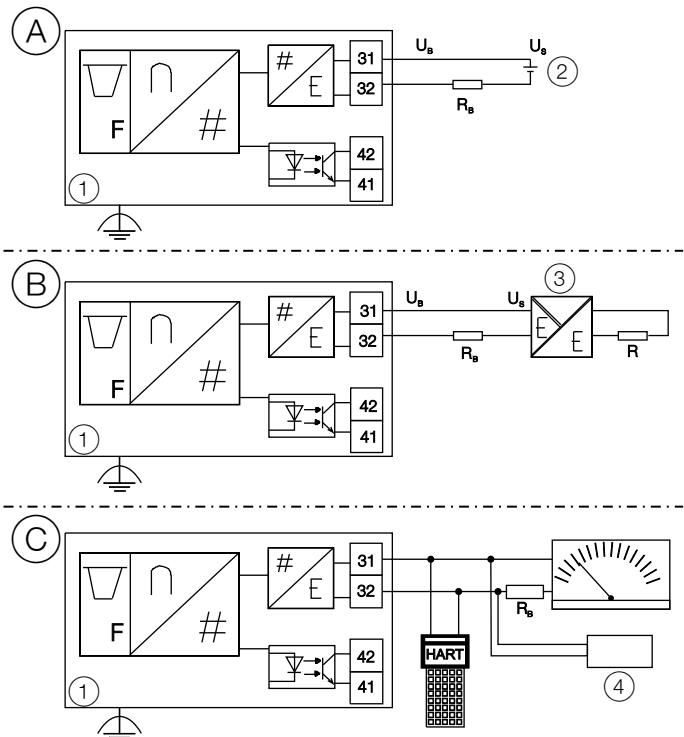

Fig. 20: Analog indicator with transmitter

- (A) Central power supply (B) Power supply via power supply unit
- (C) HART output (1) Flowmeter (2) Power supply
- (3) Power supply unit (4) HART modem

Legend

U_B	Operating voltage
U_S	Input terminal voltage
R_B	Maximum permissible load for power supply unit (e.g. indicator)
R	Maximum permissible load for output circuit; is determined by power supply unit
	Functional earth

Cables

Maximum cable length 1500 m, AWG 24 twisted and shielded.

Power supply / current output

Terminals 31 / 32 serve both as a connection for the power supply and as a 4 ... 20 mA current output for the transmitter. The current output is also used for HART communication.

Power supply

Terminals	31 / 32
Voltage	Standard: 10 ... 46 V DC Explosion-proof design: 10 ... 30 V DC.
Residual ripple	Maximum 5 % or $\pm 1.5 V_{ss}$
Power consumption	< 1 W

Current output

Terminals	31 / 32
Output	4 ... 20 mA, can be configured to 21 ... 23 mA for an alarm (in accordance with NAMUR NE43)
Load	Minimum > 250 Ω, maximum 1500 Ω (for I at alarm = 23.0 mA)
Temperature effect	$\leq 8 \mu A/K$
Power consumption	< 1 W

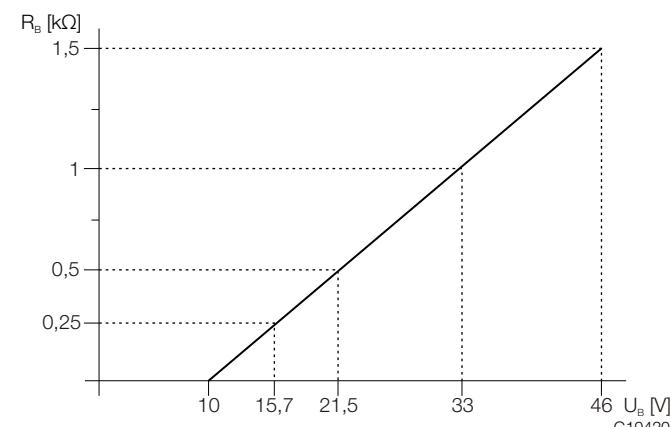

Fig. 21: Load diagram of the current output

6.5.4 HART output

Model FAM54xE/Fx

Specifications	
Terminals	31 / 32
Configuration	<ul style="list-style-type: none"> — Directly on the device — Using DAT200 Asset Vision Basic software and HART-DTM
Transmission	FSK modulation on current output 4 ... 20 mA in accordance with Bell 202 standard
Baud rate	1200 baud
Display	Logic 1: 1200 Hz Logic 0: 2200 Hz
Maximum signal amplitude	1.2 mA _{ss}
Load (R_B) at current output	250 ... 1500 Ω

See the separate interface description for detailed information.

System integration

In conjunction with the DTM (Device Type Manager) available for the device, the corresponding framework applications in accordance with FDT 0.98 or 1.2 (DAT200 Asset Vision Basic) can be used for communication (configuration, parameterization).

Other tool/system integrations (e.g., Emerson AMS/Siemens PCS7) are available on request.

The necessary DTMs and additional files can also be downloaded from www.abb.com/flow.

Programmable binary output

Terminals 41 / 42 are used as a primary programmable binary output. The pulse output, general alarm, min./max. alarm and general alarm functions, as well as "no function" can be configured using the software.

Binary output

Terminals	41 / 42
Output	<ul style="list-style-type: none"> — NAMUR contact (DIN 19234) or — Standard optoelectronic coupler ($U_H = 16 \dots 30 \text{ V DC}$)
Switching behavior	Configurable as normally closed or normally open contacts
Internal resistance	With contact open > 10 kΩ
Switching current	Maximum 15 mA
Output voltage	Minimum U_s 2 V DC

Pulse output

Terminals	41 / 42
Pulse width	5 ... 256 ms, maximum 50 % of the period
Frequency f_{\max}	Maximum 50 Hz

7 Commissioning

DANGER

Improper installation and commissioning of the device carries a risk of explosion.

For use in potentially explosive atmospheres, observe the information in chapter „Use in potentially explosive atmospheres according to ATEX and IECEx“ on page 5 and „Use in potentially explosive atmospheres in accordance with FM and cCSAus“ on page 16!

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

7.1 General information

The commissioning activities described here are performed after the device has been installed and electrically connected. Bear in mind the following during commissioning:

- The power supply must be switched off.
- When using liquid measuring media, the piping must be vented carefully to avoid pressure shocks due to gas bubbles.
- When using gaseous measuring media, increase the flow pressure slowly.
- Vary the flow with help of adjustable valves (control valves) to protect the float from shock waves. Otherwise, the flowmeter may be damaged.
- If fast opening solenoid valves are used, pressure shocks on the float must be prevented by using suitable damping measures.

7.2 Switching on the power supply

The following points must be checked before commissioning the device:

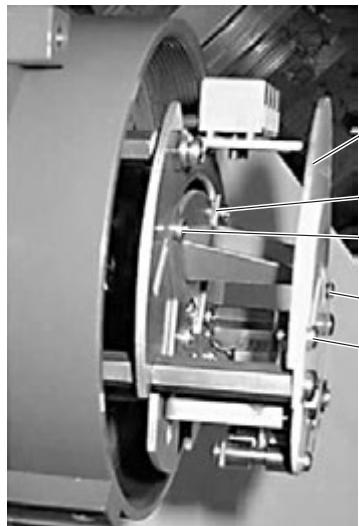

- The wiring must have been completed as described in the chapter „Electrical connections“ on page 31.
- The correct grounding of the sensor.
- The ambient conditions must meet the requirements set out in the technical data.
- The power supply must meet the requirements set out on the identification plate.

7.2.1 Inspection after switching on the power supply

The configuration of the measuring medium parameters (standard and operating density) must be checked after commissioning the device. The measuring medium parameters must be adapted to the measuring medium being used if necessary.

See the "Menu and parameter descriptions" chapter in operating instructions "OI/FAM540".

7.3 Setting the alarm signaling unit

G10432

Fig. 22

1. Unscrew the housing cover.
2. Loosen screws ① and remove cover plate ②.
3. Loosen screws ③ + ④.
4. Move the alarm signaling unit ⑤ into the desired position.
5. Tighten screws ③ + ④.
6. Replace cover plate ② and tighten screws ①.
7. Screw on housing cover.

i NOTE

For explosion proof apparatus, remove the safety locking device before opening the housing cover and reattach it after closing the housing!

7.4 Configuring the programmable output

The switch output of the transmitter is configured by default as a NAMUR contact.

The contact can also be configured as an optoelectronic coupler output.

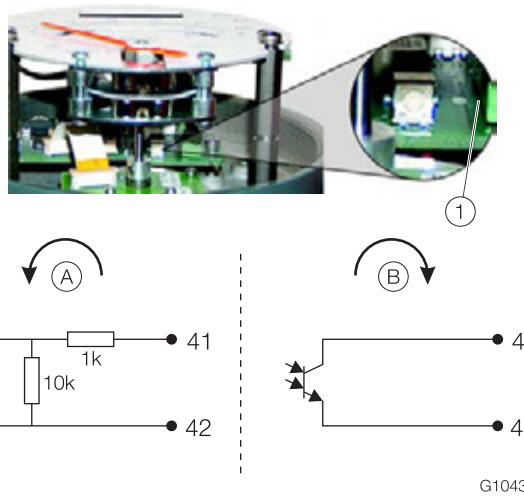

Fig. 23

- (A) Switch to left stop: NAMUR contact
- (B) Switch to right stop: optoelectronic coupler function
- (1) Rotary switch for output configuration

1. Unscrew the housing cover.

2. Bring rotary switch into the desired position.
3. Screw on housing cover.

i NOTE

For explosion proof apparatus, remove the safety locking device when opening the housing cover and reattach it after closing the housing!

7.5 Parameterization

⚠ DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

i NOTE

For detailed information on the operation and parameterization of the device, consult the associated operating instructions (OI)!

7.5.1 Menu navigation

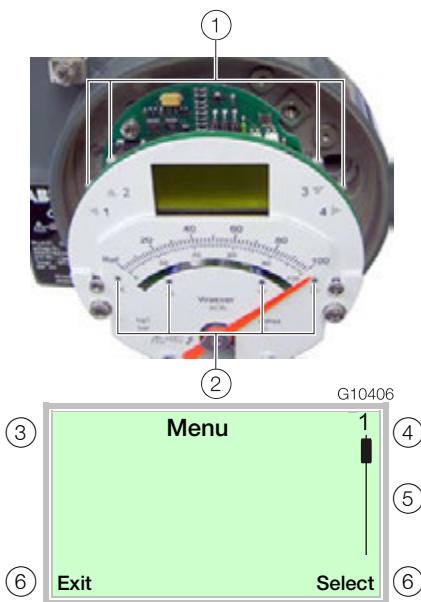

Fig. 24: LCD display

- (1) Operating buttons for menu navigation
- (2) Points for magnet stick operation
- (3) Menu name display
- (4) Menu number display
- (5) Marking to display the relative position within the menu
- (6) Display of the function of the ▲ and ▼ operating buttons

You can use the ▲ or ▼ operating buttons to browse through the menu or select a number or character within a parameter value.

Different functions can be assigned to the ◀ and ▶ operating buttons. The function that is currently assigned (6) is shown on the LCD display.

Operating button functions

◀	Meaning
Exit	Exit menu
Back	Go back one submenu
Cancel	Cancel parameter entry
Next	Select the next position for entering numerical and alphanumeric values

▶	Meaning
Select	Select submenu / parameter
Edit	Edit parameter
OK	Save parameter entered

Magnet stick operation

The magnet stick provides an alternative means of parameterizing the device even when the housing cover is closed.

To execute the functions, hold the active side of the magnet stick against the corresponding areas on the LCD indicator.

7.5.2 User levels

The device features four user levels. The user levels are selected in the "Prog. level" menu.

The following user levels are available.

User level	Description
Standard	This user level is used for quick parameterization of the device. All of the customer-specific menus / parameters required for device operation can be configured here.
Specialist	In this user level, all menus / parameters are visible.
Service	The service menu is reserved exclusively for the after-sales-service of ABB Automation Products. It includes the default settings of the device. It can only be accessed with the service code. Changes may cause the device to display incorrect information.
Locked	In the "Specialist" user level, all menus / parameters of the "Standard" are visible, but cannot be edited. After an interruption of the power supply, this user level is active

Changing the user level

Before changing parameters, select the proper user level.

1. Press the ▶ button to jump to the Main Menu.
2. Use the ▲ or ▼ buttons to select the Prog.Level entry.
3. Press the ▶ button to jump to the Prog.Level.
4. Use the ▲ and ▼ buttons to select the desired user level and press ▶ (OK) to confirm.

You can now complete parameterization in accordance with the selected user level.

8 Operation

8.1 Operating instructions

Observe the following points when operating the device:

- Aggressive media may result in corrosion and abrasion of the parts that come into contact with the medium. As a result, pressurized media may escape prematurely.
- Wear to the flange gasket or process connection gaskets (e.g., aseptic threaded pipe connections, Tri-Clamp, etc.) may enable a pressurized medium to escape.
- When using internal flat gaskets, these can become embrittled through CIP/SIP processes.

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

9 Maintenance

9.1 Safety instructions

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

CAUTION

Risk of burns due to hot measuring media.

The device surface temperature may exceed 70 °C (158 °F), depending on the measuring medium temperature!

Before starting work on the device, make sure that it has cooled sufficiently.

NOTE

Damage to components!

The electronic components of the printed circuit board can be damaged by static electricity (observe ESD guidelines).

Make sure that the static electricity in your body is discharged before touching electronic components.

NOTE

For detailed information on the maintenance of the device, consult the associated operating instructions (OI)!

VA Master FAM540

Metal Cone Variable Area Flowmeter

Measurement made easy

Power and productivity
for a better world™

ABB

Short product description

Metal Cone Variable Area Flowmeter for measuring the flow rate of the operating volume or mass flow units (at constant pressure / temperature), if a physical mass flow unit is selected.

Device firmware: Version B.20 or higher

1 Safety

1.1 General information and instructions

These instructions are an important part of the product and must be retained for future reference.

Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.

For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer.

The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.

Modifications and repairs to the product may only be performed if expressly permitted by these instructions.

Information and symbols on the product must be observed.

These may not be removed and must be fully legible at all times.

The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

1.2 Warnings

The warnings in these instructions are structured as follows:

DANGER

The signal word "DANGER" indicates an imminent danger.

Failure to observe this information will result in death or severe injury.

WARNING

The signal word "WARNING" indicates an imminent danger.

Failure to observe this information may result in death or severe injury.

CAUTION

The signal word "CAUTION" indicates an imminent danger.

Failure to observe this information may result in minor or moderate injury.

NOTE

The signal word "NOTE" indicates useful or important information about the product.

The signal word "NOTE" is not a signal word indicating a danger to personnel. The signal word "NOTE" can also refer to material damage.

1.3 Intended use

This device is intended for the following uses:

- To transmit fluid or gaseous measuring media.
- To measure the flow rate of the operating volume or mass flow units (at constant pressure / temperature), if a physical unit is selected.

The device has been designed for use exclusively within the technical limit values indicated on the identification plate and in the data sheets.

When using media for measurement the following points must be observed:

- Measuring media may only be used if, based on the state of the art or the operating experience of the user, it can be assured that the chemical and physical properties necessary for safe operation of the materials of transmitter components coming into contact with these will not be adversely affected during the operating period.
- Media containing chloride in particular can cause corrosion damage to stainless steels which, although not visible externally, can damage wetted parts beyond repair and lead to the measuring medium escaping. It is the operator's responsibility to check the suitability of these materials for the respective application.
- Measuring media with unknown properties or abrasive measuring media may only be used if the operator can perform regular and suitable tests to ensure the safe condition of the meter.

The operator bears sole responsibility for the use of the devices in relation to suitability, intended use and corrosion resistance of the materials in relation to the measuring medium.

The manufacturer is not liable for damage arising from improper or non-intended use.

Repairs, alterations, and enhancements, or the installation of replacement parts, are only permissible insofar as these are described in this manual. Approval by ABB Automation Products GmbH must be sought for any activities beyond this scope. Repairs performed by ABB-authorized specialist shops are excluded from this.

1.4 Improper use

The following are considered to be instances of improper use of the device:

- For operating as a flexible adapter in piping, e.g. for compensating pipe offsets, pipe vibrations, pipe expansions, etc.
- For use as a climbing aid, e.g. for mounting purposes
- For use as a support for external loads, e.g. as a support for piping, etc.
- Material application, e.g. by painting over the name plate or welding/soldering on parts
- Material removal, e.g. by spot drilling the housing

1.5 Warranty provisions

Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer's warranty null and void.

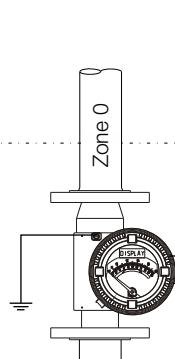

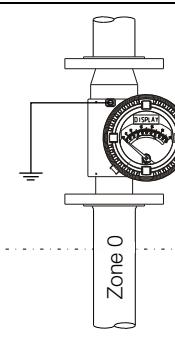

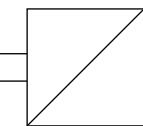

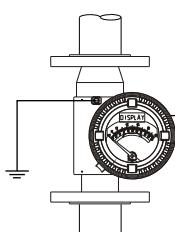

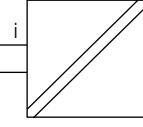

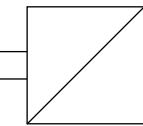

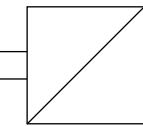

2 Use in potentially explosive atmospheres according to ATEX and IECEx

i NOTE

For further information on the approval of devices for use in potentially explosive atmospheres, refer to the type-examination certificates or the relevant certificates at www.abb.com/flow.

2.1 Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 11.

Zone 1	Zone 2	Standard / No explosion protection	Order code ¹⁾

	Ex tb IIIC T85 °C ... T _{medium} Db	Dust explosion protection	

1) Order code "Explosion protection and approvals" (versions 9, 10); refer to chapter Ordering information in the data sheet.

2.2 Installation instructions

The installation, commissioning, maintenance and repair of devices in areas with explosion hazard must only be carried out by appropriately trained personnel.

The safety instructions for electrical apparatus in potentially explosive areas must be complied with, in accordance with Directive 94/9/EC (ATEX) and IEC60079-14 (Installation of electrical equipment in potentially explosive areas).

To ensure safe operation, the requirements of EU Directive ATEX 118a (minimum requirements concerning the protection of workers) must be met.

When using in potentially explosive atmospheres, please note:

- Observe the information in chapter „Installation conditions“ on page 31 during installation of the device.
- The maximum ambient temperature for use with combustible dusts (category II 2D) is $T_{amb} = +60^{\circ}\text{C}$.
- When commissioning the flowmeter, refer to EN 60079-0 regarding use in areas with combustible dust.
- For explosion proof apparatus with PTFE liners, a minimum medium conductivity of $> 10^{-8} \text{ S/m}$ must be guaranteed.
- If zone 0 is present in the meter tube, the devices may only be installed in an environment ensuring sufficient ventilation of zone 1.
- Variable area flowmeters used in accordance with maximum electrical values for a category 3 device (zone 2) can also be used without modification as category 2 devices in zone 1 (see chapter „ on page 17).

2.2.1 Protection against electrostatic discharges

DANGER

Risk of explosion!

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

2.2.2 Sensor insulation

The device may be insulated. The maximum permissible thickness of the insulation corresponds to the flange diameter. See chapter „Sensor insulation“ on page 32.

2.2.3 Opening and closing the transmitter housing

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

Before opening the housing cover, remove the cover protector, and reattach it after closing the housing cover.

For sealing original spare parts should be used only.

NOTE

Spare parts can be ordered from ABB Service:

Please contact Customer Center Service acc. to page 2 for nearest service location.

2.2.4 Cable entries

The devices are connected electrically using a cable gland or alternatively by using conduit systems with pipe fittings. For this purpose, the devices are delivered with cable glands or alternatively with 1/2" NPT connection threads for pipe fittings.

ATEX / IECEx-approved flameproof cable glands made from metal are supplied with device versions that have type of protection Ex-d "Flameproof enclosure" (order code A9). ATEX / IECEx-approved cable glands made from plastic are supplied with device versions that have type of protection Ex-ia and Ex-nA.

The various connection possibilities depend on the device-specific configuration of the explosion protection and the "Housing material / cable connection" option in accordance with the ordering information in data sheet DS/FAM540.

To ensure proper routing of cables, the following cable diameters are required:

- Ex d design: 7.2 ... 11.7 mm (0.28 ... 0.46 inch)
- Other designs: 5.0 ... 9.0 mm (0.20 ... 0.35 inch)

Devices with 1/2" NPT threads and ATEX and IECEx approvals (except for "Ex d") can be ordered and operated without cable glands. The operator is responsible for properly installing threaded conduit connections in accordance with national regulations (e.g., NEC, CEC, ATEX137, IEC60079-14, etc.).

2.2.5 Type of protection Ex d - flameproof enclosure

Model FAM540, order code A9

The flowmeter is electrically connected via the ATEX / IECEx-approved cable gland with type of protection Ex-d (see Fig. 1) located on the device.

Alternatively, the flowmeter can be connected using conduit systems. In type of protection Ex-d, the connection must be made with an ATEX / IECEx-approved pipe fitting with a flame barrier. The mechanical ignition barrier must be installed directly on the housing.

The preinstalled cable gland must be removed before connecting a pipe fitting. The M25 x 1.5 / 1/2" NPT adapter remains unchanged on the device.

i NOTE

Pipe fittings with flame barriers are not included in the scope of supply.

Only ATEX / IECEx-approved pipe fittings with a flame barrier may be used with type of protection Ex-d. The use of cable and wire entries, pipe fittings or sealing plugs without an Ex-d type examination certificate is prohibited.

Unused openings must be closed with Ex-d-approved sealing plugs.

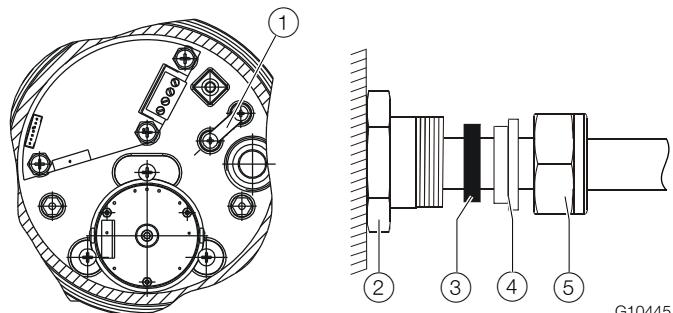

Fig. 1: Connection using a flameproof cable gland
① Strain relief ② M25 x 1.5 / 1/2"-NPT adapter ③ Gasket
④ Sleeve ⑤ Union nut

The outside diameter of the unshielded connection cable must be between 7.2 ... 11.7 mm (0.3 ... 0.5 inch). After installing the cable in the fitting, tighten the union nut using a torque of 3.25 Nm (2.40 lb/in). Use additional strain relief in the housing to secure the connection cable.

2.2.6 Electrical connections

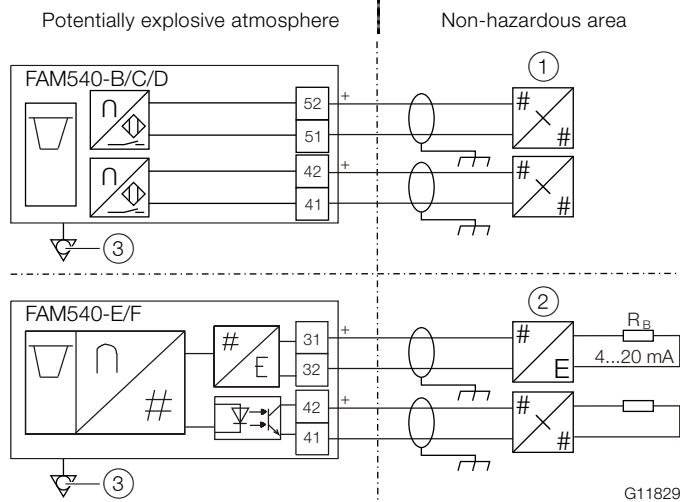

Fig. 2: ATEX / IECEx electrical connection

- (1) NAMUR switching amplifier (2) Safety barrier
- (3) Potential equalization

Terminal	Function
31 / 32	Power supply / current output / HART output
41 / 42	Programmable binary output Alarm signaling unit (min.)
51 / 52	Alarm signaling unit (max.)

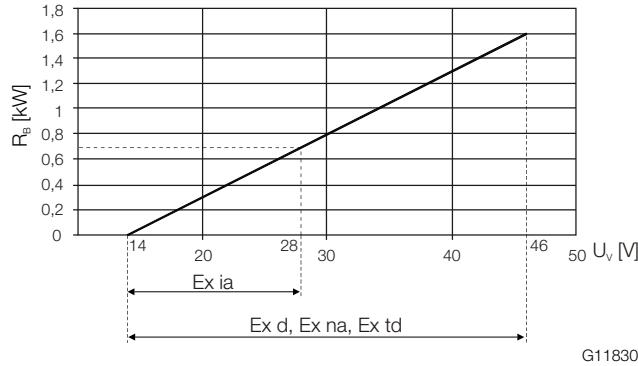

Fig. 3: Terminals 31 / 32, power supply / load

U_V Power supply

R_B Maximum permissible load in the power supply (e.g. indicator)

The minimum voltage U_V = 0 V is based on a load of 0 Ω.

Signal cable

The Ex calculations are based on temperatures of 80 °C (176 °F) at the cable input. For this reason, cables with a specification of 80 °C (176 °F) must be used.

For cables limited to 70 °C (158 °F), a maximum ambient temperature of $T_{amb} = 60 °C$ (140 °F) applies.

The resulting new maximum measuring medium temperatures are determined as follows:

- Calculate a new ambient temperature:
 $T_{amb\ new} = T_{amb} + 10 °C$ (18 °F).
- Use the calculated ambient temperature $T_{amb\ new}$ to determine the new associated permissible measuring medium temperatures in the tables.
- Please use the limit value tables with the original ambient temperature T_{amb} to determine the relevant temperature class. See chapter „Safety specifications ATEX / IECEx“ on page 12, Tables 1 through 5.

Example:

- $T_{amb} = 50 °C$ (122 °F) becomes
 $T_{amb\ new} = 60 °C$ (140 °F).
- Determine the measuring medium temperature
 $T_{amb} = 60 °C$ (140 °F).
- Determine the temperature class for
 $T_{amb} = 50 °C$ (122 °F).

Earthing

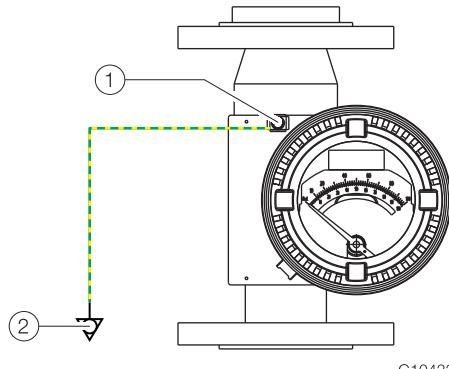

Fig. 4: Earthing

- (1) Earthing terminal

- (2) Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

2.3 Safety specifications ATEX / IECEEx

2.3.1 Special conditions for type of protection "Ex td" (dust explosion protection)

Model FAM54xB/C/D/E/Fx

The following differing temperature data applies to usage in areas with combustible dust.

Order code	Ambient temperature T_{amb}	Maximum permissible measuring medium temperature T_{medium}
A4, A9, B1	-50°C... +60°C	250 °C
	-50°C... +40°C	340 °C
	-50°C... +20°C	430 °C

2.4 Operating instructions**2.4.1 Protection against electrostatic discharges****DANGER****Risk of explosion!**

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

2.4.2 Changing the type of protection

Depending on the model, the device may be designed to be installed in one of the applications listed. If you plan to use a device that was installed in one type of protection rating in a different type of protection rating, some measures must be taken before connecting voltage to the device.

Measures for devices with alarm signaling unit FAM540-B/C/D:

Original installation	New installation	Necessary test steps
XP or Ex d $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
	NI or Ex nA	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
IS or Ex ia	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.
	NI or Ex nA	No special measures required.
NI or Ex nA $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 51 / 52 and 41 / 42 and terminals 51 / 52 / 41 / 42 and the housing. — Visual inspection: no explosion, no damage.
	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.

1) Possible only if the maximum signal levels of $U_M \leq 60 \text{ V}$ (e.g., PELV or SELV circuits) were not previously exceeded.

Measures for devices with transmitter with or without LCD display FAM540-E/F.

Original installation	New installation	Necessary test steps
XP or Ex d $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards. — Visual inspection: no explosion, no damage.
	NI or Ex nA	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards. — Visual inspection: no explosion, no damage.
IS or Ex ia	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.
	NI or Ex nA	No special measures required.
NI or Ex nA $U_M = 60 \text{ V}$	IS or Ex ia ¹⁾	<ul style="list-style-type: none"> — 500 V AC / 1min test between terminals 31 / 32 and 41 / 42 and terminals 31 / 32 / 41 / 42 and the housing. — Visual inspection: No damage, especially to electronics boards.
	XP or Ex d	<ul style="list-style-type: none"> — Visual inspection: no damage to threads (cover, surface, 1/2" NPT cable input), cable gland, glass, housing, locking device for cover, suitable cable, etc.

1) Possible only if the maximum signal levels of $U_M \leq 60 \text{ V}$ (e.g., PELV or SELV circuits) were not previously exceeded.

3 Use in potentially explosive atmospheres in accordance with FM and cCSAus

i NOTE

For further information on the approval of devices for use in potentially explosive atmospheres, refer to the type-examination certificates or the relevant certificates at www.abb.com/flow.

3.1 Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to chapter „Electrical connections“ on page 21.

Class 1 Division 1 / Zone 1	Class 1 Division 2 / Zone 2	Standard / No explosion protection	Order code ¹⁾
			F4 (NI, IS)
			F3 (NI, IS, XP)
			G11831

Potential equalization

1) Order code "Explosion protection and approvals" (versions 9, 10); refer to chapter „Ordering information in the data sheet“ on page 53.

3.1.1 Ex-marking

i NOTE

- Depending on the design, a specific marking in accordance with FM applies.
- ABB reserves the right to modify the Ex-marking. Refer to the name plate for the exact marking.

1) Order code "Explosion protection and approvals" (version digit No. 9, 10); refer to chapter Ordering information in the data sheet.

3.2 Installation instructions

The installation, commissioning, maintenance and repair of devices in areas with explosion hazard must only be carried out by appropriately trained personnel.

The operator must strictly observe the applicable national regulations with regard to installation, function tests, repairs, and maintenance of electrical devices. (e.g. NEC, CEC).

Intrinsic Safety Control Drawing

i NOTE

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing".

See chapter "Intrinsic Safety Control Drawing SDM-10-A0253" on page 58.

3.2.1 Sensor insulation

The device may be insulated. The maximum permissible thickness of the insulation corresponds to the flange diameter. See chapter „Sensor insulation“ on page 32.

3.2.2 Opening and closing the transmitter housing

⚠ DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

⚠ WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

Before opening the housing cover, remove the cover protector, and reattach it after closing the housing cover.

For sealing original spare parts should be used only.

i NOTE

Spare parts can be ordered from ABB Service:

Please contact Customer Center Service acc. to page 2 for nearest service location.

3.2.3 Cable entries

Devices with FM and CSA approval are delivered for electrical connection using conduit systems that have 1/2" NPT connection threads and are sealed with dust protection plugs. Alternatively, cable glands with 1/2" NPT thread can be used for the connection. National guidelines (NEC, CEC) must be observed.

For operation with type of protection XP "Explosionproof", the installation instructions in chapter "Type of protection XP "Explosion proof"" must be observed.

3.2.4 Type of protection XP "Explosion proof"

For operation with type of protection XP "Explosion proof", the connection is made using Ex-approved pipe fittings with a flame barrier with type of protection XP.

In Group A and B hazardous areas, the flame barriers must be installed within a distance of 46 cm (18.1 inch) from the device.

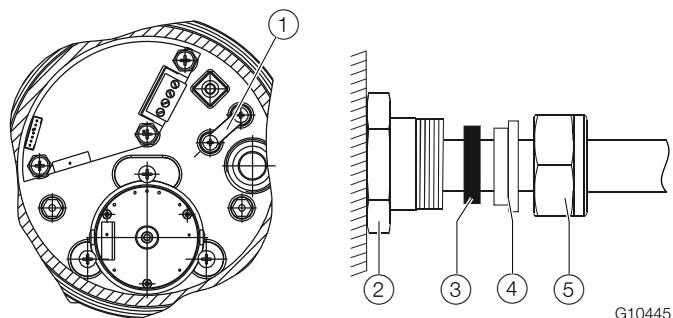

When using cable glands for the connection, Ex-approved cable glands with type of protection XP or Ex-d must be used (see Fig. 5).

i NOTE

There must be a separate XP type examination certificate for the pipe fitting.

The use of standard cable and wire entries and sealing plugs is prohibited.

The pipe fitting is not included in the scope of supply.

G10445

Fig. 5: Connection using a flameproof cable gland

① Strain relief ② M25 x 1.5 / 1/2"-NPT adapter ③ Gasket

④ Sleeve ⑤ Union nut

The outside diameter of the unshielded connection cable must be between 8.0 ... 11.7 mm (0.3 ... 0.5 inch).

The cable gland must be dimensioned accordingly.

After installing the cable in the gland, tighten the union nut to a torque of 3.25 Nm (2.40 lbf/in).

Use an additional strain relief device in the housing to secure the connection cable.

3.2.5 Electrical connections

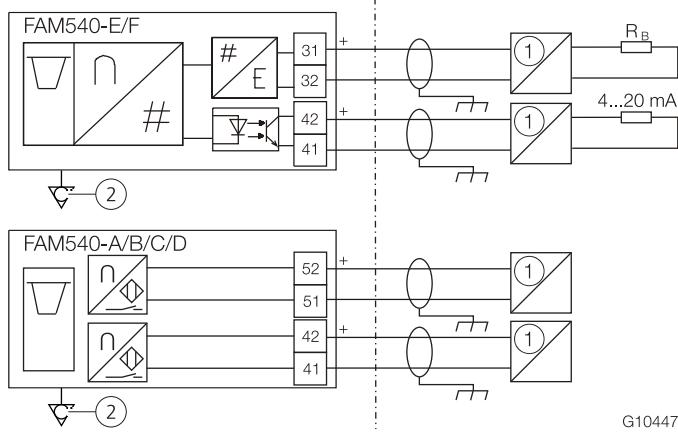

Fig. 6: FM / cCSAus electrical connection

 R_B Maximum permissible load in the power supply (z. B. indicator)

The minimum voltage U_V = 0 V is based on a load of 0 Ω.

Installation instructions

The concept of intrinsic safety enables multiple intrinsic safety devices with FM or CSA approval to be interconnected, without entity parameters being examined specifically, subject to observation of the following conditions:

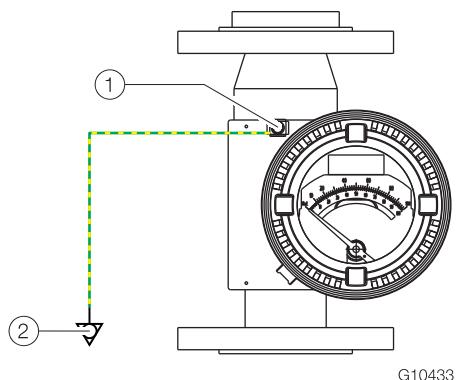

- U_o or V_{oc} or V_t ≤ 0 V max, I_o or I_{sc} or I_t ≤ I_{max}, C_a or C_o ≥ C_i + C_{cable}, L_a or L_o ≥ L_i + L_{cable}, P_o ≤ P_i.
- For installation in Class II and III environments, dust-proof ignition blocks must be used.
- Devices connected to such apparatus must not use or generate rms or direct voltages in excess of 250 V.
- Installation must meet the requirements of ANSI / ISA RP 12.6 "Installation of Intrinsically Safe Systems for Hazardous (Classified) Locations" and the National Electrical Code (ANSI / NFPA 70) sections 504, 505 and CEC.
- The configuration of the associated apparatus must have Factory Mutual Research and CSA approval in accordance with the entity concept.
- Devices must be installed in compliance with the manufacturer-supplied installation drawing of the associated apparatus.
- Changes to drawings are only permitted subject to prior approval from Factory Mutual Research and CSA.
- Only shielded twisted pair cables may be used (see above).

i NOTE

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing".

See chapter "Intrinsic Safety Control Drawing SDM-10-A0253" on page 58.

Earthing

G10433

Fig. 8: Earthing

(1) Earthing terminal

(2) Potential equalization in accordance with EN 60079-0

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

i NOTE

The operator must ensure that when connecting the protective earth (PE), there are no potential differences between protective earth (PE) and potential equalization, even in the event of a fault.

Signal cable

For ambient temperatures below 5 °C (41 °F) or above 40 °C (104 °F), signal cables that are suited for the minimum/maximum ambient temperatures in question must be used.

Only use signal cables made from copper, copper-coated aluminum, or aluminum.

The recommended tightening torque for the terminals is 0.8 Nm (7 in. lb) or higher, in accordance with the specification.

Power supply

Installation must comply with the requirements of the National Electric Code® (ANSI / NFPA70).

Unless specified otherwise in regional or national standards, power supply lines must be dimensioned to AWG 20.

Installation must be carried out as outlined in the latest edition of the manufacturer's instruction manual.

A power supply with the following requirements must be used to provide power:

- SELV (safety extra-low voltage) with LPS (current-limited source) and double or reinforced insulation.
- Maximum output current of 8 A (current-limited output).
- In accordance with National Electric Code® (ANSI / NFPA70) connected to NEC class 2.

4) For connection to a non-intrinsically safe circuit.

5) For connection in Division 2 or Zone 2.

3.4 Operating instructions

3.4.1 Protection against electrostatic discharges

DANGER

Risk of explosion!

The painted surface of the device can store electrostatic charges. As a result, the housing can form an ignition source due to electrostatic discharges in the following conditions:

- The device is operated in environments with a relative humidity of $\leq 30\%$.
- This painted surface of the device is therefore relatively free from impurities such as dirt, dust or oil.

The instructions on avoiding the ignition of hazardous areas due to electrostatic discharges in accordance with the EN TR50404 and IEC 60079-32-1 standards must be observed!

Instructions on cleaning

The painted surface of the device may be cleaned only using a moist cloth.

3.4.2 Changing the type of protection

The device can be operated with various types of protection:

- When connecting to an intrinsically safe circuit in CL 1 Div. 1 or Zone 1, with type of protection "Intrinsic Safety (IS)".
- When connecting to a non-intrinsically safe circuit in CL 1 Div. 1 or Zone 1, with type of protection "Explosion proof (XP)".
- When connecting to a non-intrinsically safe circuit in CL 1 Div. 2 or Zone 2, with type of protection "Non-Ignitable (NI)".

Depending on the model, the device may be designed to be installed in one of the applications listed. If you plan to use a device that was installed for one Ex type of protection with a different Ex type of protection, some measures must be taken before connecting voltage to the device.

When changing the type of protection, chapter „ on page 17 must be adhered to.

Special information

Replacing components can affect the device's approval for use in Class I, Div. 1 and Class I, Div. 2.

If the device was not operated with type of protection XP or IS, but with type of protection NI, the device is only suitable for use in Class I, Div. 2, Group A, B, C, D or in non-hazardous areas.

4 Function and System Design

4.1 General remarks

FAM540 metal cone variable area flowmeters have a proven design and are equipped with an analog, mechanical indicator or an intelligent two-wire transmitter, i.e. the power supply and the flow signal utilize the same leads.

FAM540 metal cone variable area flowmeters can be used to measure the flow of gases, liquids and steam, e.g., in process engineering, the chemical and pharmaceutical industries as well as the food and beverage industry. They are especially suited for use with aggressive or opaque measuring media, and are ideal when glass tube variable area flowmeters cannot be used due to safety considerations. For high pressures and temperatures, a metal cone variable area flowmeter is often an essential requirement.

Key features of the device with transmitter include the ability to subsequently adjust devices on site to changed operating conditions, support for the HART® protocol, and an integrated contact output that can be configured via software. The HART protocol is used for digital communication between a distributed control system or PC, a handheld terminal and the flowmeter.

The modular design of the float enables, within specific limits, the measuring range to be changed subsequently. This permits devices already in use to be used for different measurement tasks. It also permits devices in temporary storage to be modified swiftly for a variety of measurement tasks.

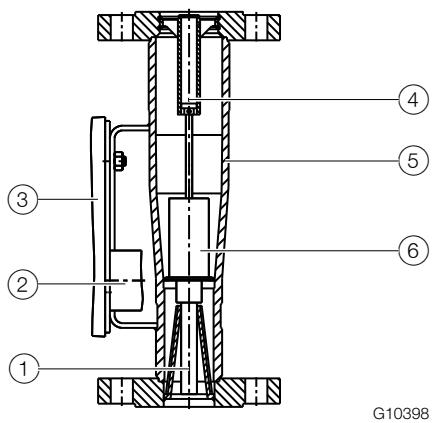

The main section consists of a conical metal meter pipe with welded flanges.

A magnet in the float translates the height of the float as a measurement for the flow to the decouple-proof magnet follower system of the flowmeter.

The flow rate value is indicated on a scale by a pointer mounted on a rotating shaft.

As an optional feature a modular two-wire transmitter can be added to convert the flow rate value into a proportional, linear 4 ... 20 mA output signal. It is also possible to display the flow rate value on a two-line LCD indicator, independent of the pointer position.

The LCD indicator, which can be configured in a plain text dialog, can be used to display the real-time flow rate and cumulative totalizer value, as well as to conveniently configure parameters.

5 Product identification

5.1 Name plate

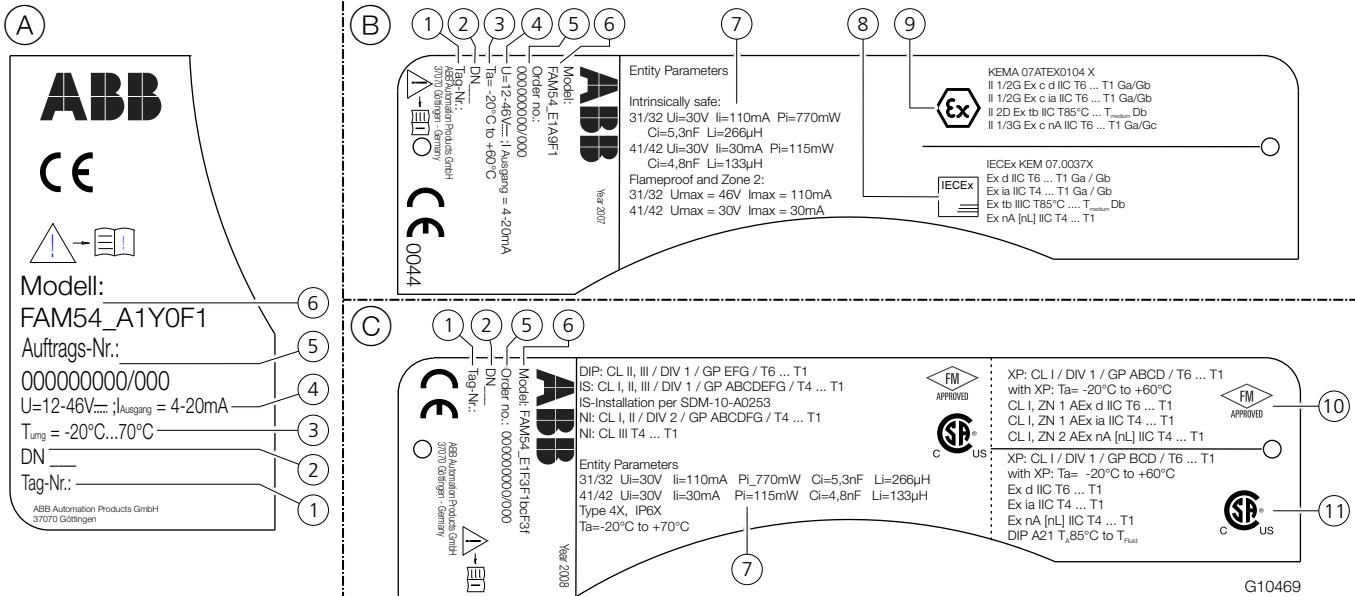

Fig. 10: Name plates (examples)

(A) Standard (B) ATEX / IECEx (C) FM / cCSAus

- (1) TAG number
- (2) Nominal size and degree of protection
- (3) Ambient temperature
- (4) Power supply / output current
- (5) Order number
- (6) Model number
- (7) Electrical data (Ex)
- (8) IECEx approval
- (9) ATEX approval
- (10) FM approval
- (11) cCSAus approval

i NOTE

The name plates displayed are examples. The device identification plates affixed to the device can differ from this representation.

5.2 Factory plate

The factory plate is on the flowmeter in addition to the name plate. Depending on the nominal size of the flowmeter ($>$ DN 25 or \leq DN 25), it is identified with two different factory plates (also refer to article 3, paragraph 3 Pressure Equipment Directive 97/23/EC):

Pressure equipment within the scope of the Pressure Equipment Directive

Fig. 11: Factory plate for meter tube size $>$ DN 25 (example)

- (1) Nominal size and nominal pressure rating
- (2) Material
- (3) Year of manufacture
- (4) Address of the manufacturer
- (5) Serial number
- (6) CE mark
- (7) Specification of the fluid group in accordance with Pressure Equipment Directive

Below the CE mark, the number of the designated authority to confirm that the device meets the requirements of Pressure Equipment Directive is specified. The respective fluid group in accordance with the Pressure Equipment Directive is indicated under PED. Example: Fluid group 1 = hazardous fluids, gaseous.

Pressure equipment within the scope of the Pressure Equipment Directive

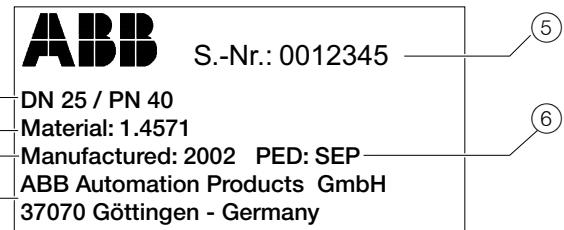

Fig. 12: Factory plate for meter tube size \leq DN 25 (example)

- (1) Nominal size and nominal pressure rating
- (2) Material
- (3) Year of manufacture
- (4) Address of the manufacturer
- (5) Serial number
- (6) Reason for exception under article 3, paragraph 3 of the Pressure Equipment Directive

Under PED, the reason for the exception in article 3, paragraph 3 of the Pressure Equipment Directive is specified. The pressure equipment is classified in the SEP (= Sound Engineering Practice) "Good Engineering Practice" category.

i NOTE

If the factory plate is not present, the device is not in compliance with Directive 97/23/EC. Networks for the supply, distribution and discharge of water and related specific accessories are classed as an exception in accordance with guideline 1/16 of Art. 1, Para. 3.2 of the Pressure Equipment Directive.

6 Transport and storage

6.1 Inspection

Check the devices immediately after unpacking for possible damage that may have occurred from improper transport.

Details of any damage that has occurred in transit must be recorded on the transport documents.

All claims for damages must be submitted to the shipper without delay and before installation.

6.2 Transport

DANGER

Life-threatening danger due to suspended loads.

In the case of suspended loads, a danger of the load falling exists.

Remaining under suspended loads is prohibited.

When transporting the device, please note:

- The center of gravity of some devices is not at the center of the equipment.
- The protection plates or dust caps mounted at the process connections of devices equipped with PTFE/PFA may only be removed immediately before installation. To prevent possible leakage, ensure that the liner on the flange is not cut or damaged.
- Ensure that small internal parts such as floats or cones do not fall out and become damaged.

6.3 Storage

Bear the following points in mind when storing devices:

- Store the device in its original packaging in a dry and dust-free location.
- Observe the permitted ambient conditions for transport and storage.
- Avoid storing the device in direct sunlight.
- In principle, the devices may be stored for an unlimited period. However, the warranty conditions stipulated in the order confirmation of the supplier apply.

The ambient conditions for the transport and storage of the device correspond to the ambient conditions for operation of the device.

Adhere to the device data sheet!

6.4 Returning devices

For the return of devices, follow the instructions in the chapter „Repair“ on page 51.

7 Installation

7.1 Installation conditions

- The installation recommendations of VDI / VDE Directive 3513 must be observed.
- The flowmeter is installed vertically in the piping. The measuring media must flow from bottom to top.
- Keep the device as far as possible from pipe vibrations and powerful magnetic fields.
- The piping should be the same size as the connection size of the flowmeter.
- Inlet and outlet sections are generally not required. Care should be taken to avoid flow turbulence, pulsations, pressure shocks and other flow instabilities in order to prevent measuring inaccuracies, increased wear or damage.
- When selecting devices, pay close attention to the chemical resistance of the wetted parts of the device and the process connection gaskets in relation to the measuring medium.
- Avoid pulsating flow of the measuring medium. Use the optional float damping if necessary.
- For gaseous measuring media we recommend an undisturbed inlet length of five times the inside diameter of the piping in accordance with VDI / VDE Directive 3513 sheet 3. Additional measures such as flow straighteners or perforated plates may be necessary for highly unbalanced flow profiles.
- Avoid contamination of gaseous measuring media (refer to BGR 132-7.3.2.2.2).
- For liquid measuring media, the nominal size of the piping should be dimensioned as large as possible (if economically viable).
- Avoid gas inclusions in liquid measuring media.
- Use slow opening valves.
- If the flowmeter is installed in a pipeline where decommissioning is impossible or inexpedient, a bypass line should be provided.

- Shut-off and throttle valves should preferably be attached to the outlet of the flowmeter.

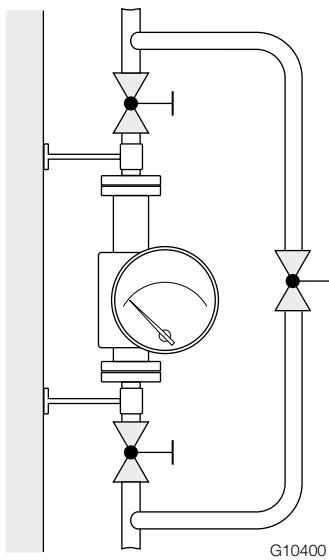

Fig. 13: Installation of the flowmeter (example)

Refer to VDI/VDE Directive 3513 sheet 3, Selection and Installation Recommendations for Variable Area Flowmeters.

7.1.1 Sensor insulation

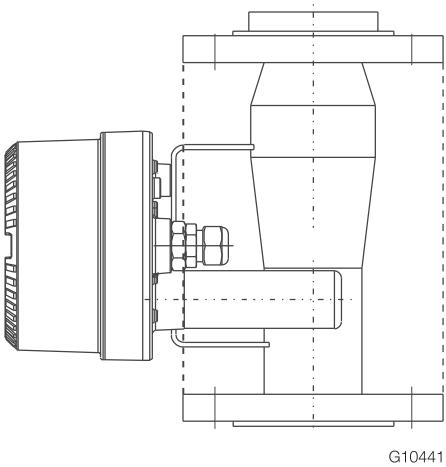

Fig. 14: Insulation of the flowmeter

As shown in Fig. 14, the flowmeter may only be insulated up to the flange diameter.

7.2 Operating conditions

A variable area flowmeter is specified for a defined set of operating conditions of the measuring medium. For liquids and gases, these are pressure and temperature-related properties (density and viscosity) under operating conditions.

For gases, in particular, this means operating at a specific operating pressure and operating temperature. The specified accuracy of the device always refers to the operating conditions underlying the specification.

7.2.1 Temperature data

The following diagram shows the maximum permissible measuring medium temperature depending on the ambient temperature.

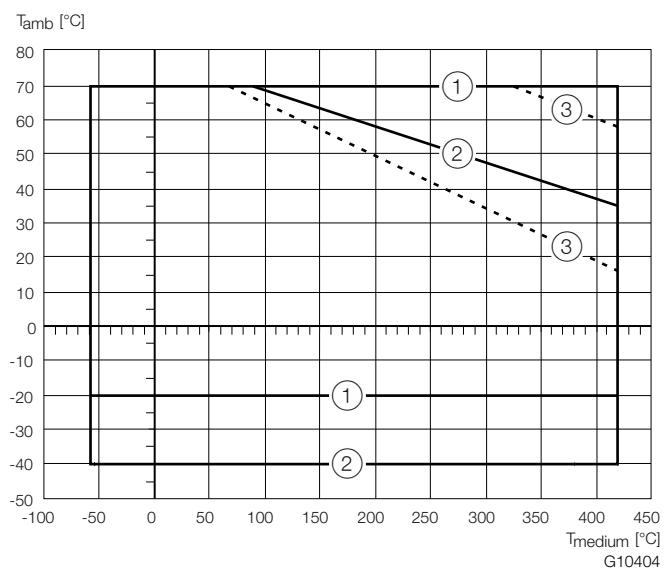

Fig. 15: Medium temperature (T_{medium}), ambient temperature (T_{amb})

- ① Devices with alarm output -20 ... 70 °C (-4 ... 158 °F)
- ② Devices with current output -40 ... 70 °C (-40 ... 158 °F)
- ③ With insulation

NOTE

When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from „Safety specifications ATEX / IECEx“ on page 12 and the FM / cCSAus limit values tables starting from „Safety specifications FM, cCSAus“ on page 23!

7.2.2 Pressure loss

The available operating pressure at the measuring point must be higher than the pressure loss listed for the flowmeter in the specifications.

It is important to also consider the pressure loss downstream from the flowmeter due to losses in the piping and other fittings.

7.2.3 Prevention of compression oscillations when measuring gases

With low flow amounts and low operating pressure, so-called compression oscillations of the float can occur.

If the maximum upstream pressure listed in the specifications is not reached, the flowmeter can optionally be equipped with a gas damper.

To prevent self-generated compression oscillations, note the following information from VDI / VDE 3513 Sheet 3:

- Select a flowmeter with the lowest possible pressure loss.
- Minimize the piping length between the flowmeter and the closest up or downstream throttling location.
- Restrict the usual measuring range from the usual 10 ... 100 % to 25 ... 100 %.
- When setting the flow rate value, always start assuming larger values.
- Increase the operating pressure and consider its effect on the flow rate values due to the change in gas density at the new operating conditions.
- Minimize non-throttled, free volumes upstream and downstream of the device.

7.2.4 Pressure shocks

Especially when measuring gases, it is possible that pressure or shock waves can occur when fast opening solenoid valves are employed and the piping cross-sections are not throttled, or if there are gas bubbles in liquids.

As a result of the sudden expansion of the gas in the piping, the float is forcibly driven against the upper floatstop.

Under certain conditions, this can lead to destruction of the device.

Gas damping is not suited to compensating for pressure shocks!

7.2.5 Solids content in the measuring medium

Variable area flowmeters have only limited suitability for measuring media containing solids.

Depending on the concentration, particle size and type of solid, increased mechanical abrasion may occur, especially at the critical measuring edge of the float.

In addition, solidified deposits on the float can change its weight and shape.

These effects can lead to erroneous measurement results, depending on the float type.

In general, the use of appropriate filters is recommended in such applications.

For the flow measurement of measuring media containing magnetic particles, we recommend the installation of a magnetic separator upstream of the variable area flowmeter.

7.3 Float designs

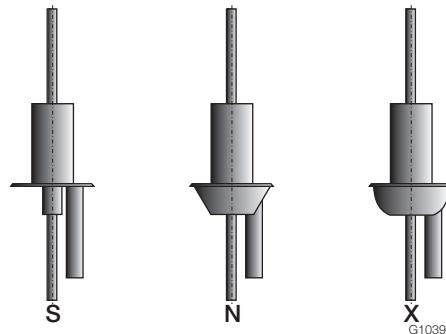

Fig. 16: Float designs

Float "S":

Basic shape of float.

Low flow rates, minimal pressure losses, essentially independent of viscosity; lower upstream pressure required for gas measurement.

Float "N":

Higher flow ranges, average pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

Float "X":

Highest flow rates, maximum pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

7.3.1 Measuring range limits

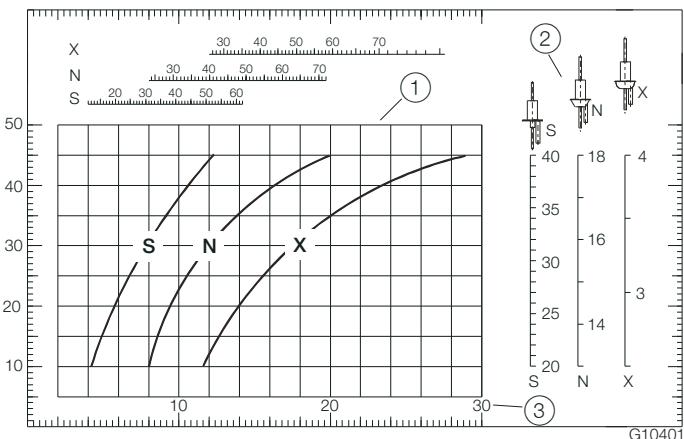

Fig. 17: Flow rate depending on float shape and weight (example)

- (1) Pressure loss (dP in mbar) (2) Diameter of the float weight (mm)
(3) $\times 1000 \text{ l/h water}$

For measuring range limits depending on nominal size and float type, refer to the measuring range tables.

7.4 Installation

The following points must be observed during installation:

- The flow direction must correspond to the direction indicated on the device, if labeled.
- The maximum torque must not be exceeded for all flange connections.
- The devices must be installed without mechanical tension (torsion, bending).
- Install flange devices with coplanar counter flanges and only use appropriate gaskets.
- Only gaskets made from a material that is compatible with the measuring medium and the measuring medium temperature may be used.
- Gaskets must not extend into the flow area since possible turbulence could influence device accuracy.
- The piping may not exert any impermissible forces or torques on the device.
- Do not remove the sealing plugs in the cable glands until you are ready to install the electrical cable.
- Make sure the gaskets for the housing cover are seated correctly. Carefully seal the cover. Tighten the cover fittings.
- Do not expose the transmitter to direct sunlight; where necessary, provide appropriate sun protection.

7.4.1 Flowmeter installation

i NOTE

Potential damage to the device!

- Vacuum shocks in the piping must be prevented for devices with PTFE liners (FAM545). Vacuum shocks can destroy the device.

The device can be installed at any location in a pipeline under consideration of the installation conditions.

1. Remove protective plates, if present, from above and below the meter tube. Ensure that internal parts such as floats or the conical meter pipe do not fall out and become damaged.
2. Remove the wooden stick serving as a transport securing device from the meter tube.
3. Position the meter tube coplanar and centered between the piping.
4. Install gaskets between the sealing surfaces.

i NOTE

For achieve the best results, ensure the gaskets fit concentrically with the meter tube

5. Use the appropriate screws for the holes.
6. Slightly grease the threaded nuts.
7. Tighten the nuts in a crosswise manner as shown in the figure.

i NOTE

Torques for screws depend on temperature, pressure, screw and gasket materials. The relevant applicable regulations must be taken into consideration.

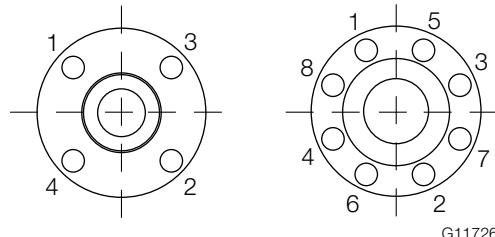

Fig. 18: Tightening sequence for the flange screws

7.4.2 Material loads for process connections

i NOTE

Potential damage to the device!

Exceeding the permissible measuring medium temperature can damage the gaskets and the device.

Do not exceed the maximum permissible measuring medium temperature specified on the factory and name plate as well as in the following tables.

Model FAM544 - Hygienic design

Process connection	Nominal Diameter	PS _{max}	TS _{min}	TS _{max}
DIN 11851	DN 15 ... 40 (1/2 ... 1 1/2")	40 bar (580 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 50 ... 100 (2 ... 4")	25 bar (362 psi)	-40 °C (-40 °F)	140 °C (284 °F)
	DN 125 (5")	16 bar (232 psi)	-40 °C (-40 °F)	140 °C (284 °F)
SMS 1145	DN 38 ... 102 (1 1/2 ... 4")	6 bar (87 psi)	-40 °C (-40 °F)	140 °C (284 °F)

Model FAM541 - Standard design

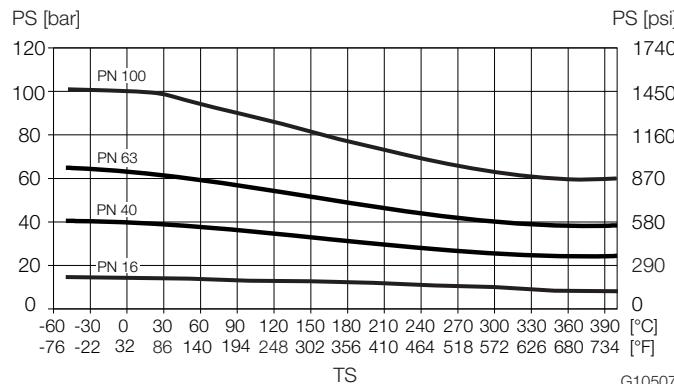

Fig. 19: DIN flange made from stainless steel

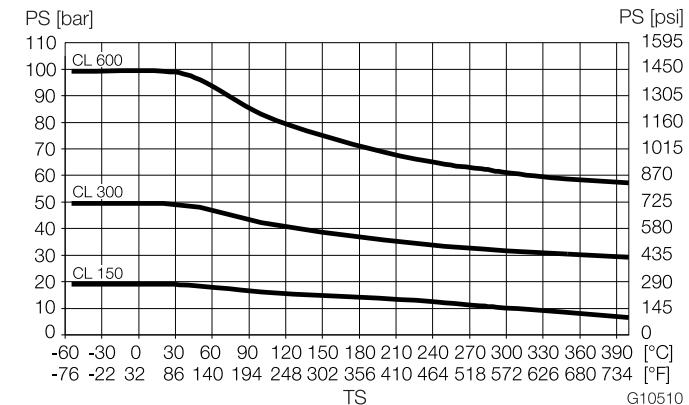

Fig. 22: ASME flange made from stainless steel

7.5 Electrical connections

DANGER

Improper installation and commissioning of the device carries a risk of explosion.

For use in potentially explosive atmospheres, observe the information in chapter „Use in potentially explosive atmospheres according to ATEX and IECEx“ on page 7 and „Use in potentially explosive atmospheres in accordance with FM and cCSAus“ on page 18!

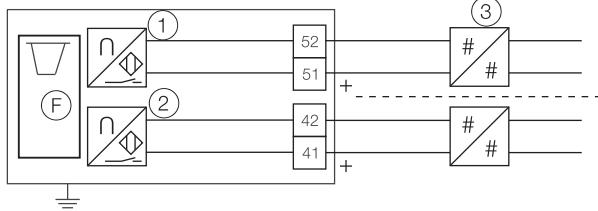

The electrical connection may only be established by authorized specialist personnel and in accordance with the connection diagrams.

The electrical connection information in the manual must be observed; otherwise, the type of electrical protection may be adversely affected.

Ground the measurement system according to requirements.

7.5.1 Analog indicator with alarm signaling unit

Model FAM54xB/C/Dx

G10431

Fig. 23: Alarm signaling unit

- ① Maximum alarm signaling unit ② Minimum alarm signaling unit
- ③ Switch amplifier F Flowmeter

Additional switching amplifiers are needed to operate the alarm signaling units.

See chapter „Switching amplifier“ on page 36 and the “Ordering information” section of the data sheet for further information.

Alarm signaling unit specifications

Operating mode	bistable
Reproducibility	±0.5% of scale end value
Nominal voltage	8 V DC (R _i approx. 1 kΩ)
Operating voltage	5 ... 25 V DC
Switching frequency, max.	3 kHz

7.5.2 Switching amplifier

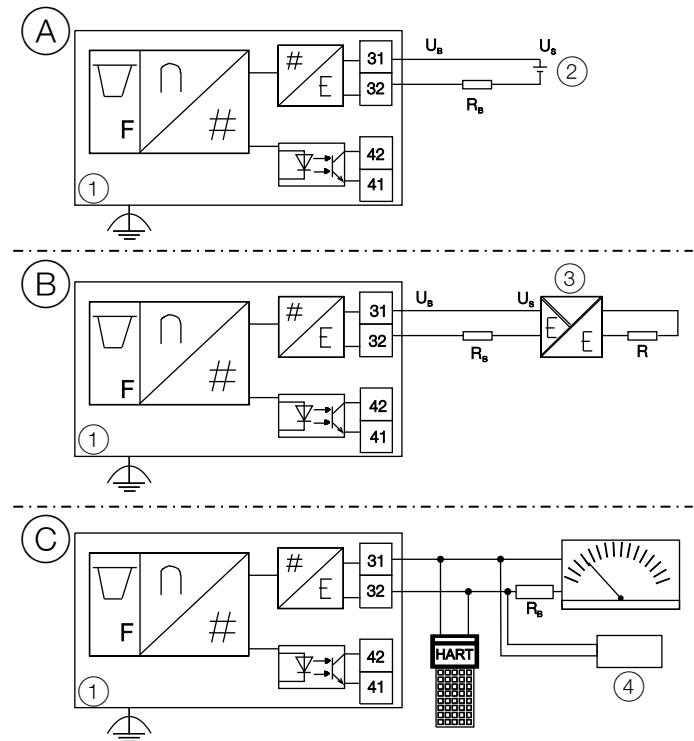

For analog indicators with alarm signaling units (model FAM54xB/C/Dx)

Specifications

Power supply	230 V AC, +10 % / -15 %, 45 ... 60 Hz 115 V AC, +10 % / -15 %, 45 ... 60 Hz 24 V DC, +10 % / -15 %
Output	1 or 2 switching relays with potential-free changeover contacts
Switching capacity	Maximum 250 V, maximum 4 A, maximum 500 VA
Maximum permissible cable length	Between switch amplifier and alarm signaling unit: 300 m (984 ft)
Permissible ambient temperature	-20 ... 60 °C (-4 ... 140 °F)
Electrical connection	Screw terminals, maximum 2.5 mm ² (14 AWG)
Type of assembly	35 mm top-hat rail in accordance with EN 60715:2001
IP rating	IP20 in accordance with EN 60529
Weight	Approx. 150 g (0.3 lb)

7.5.3 Analog indicator with transmitter

Model FAM54xE/Fx

G10418

Fig. 24: Analog indicator with transmitter

- Ⓐ Central power supply Ⓑ Power supply via power supply unit
- Ⓒ HART output
- ① Flowmeter ② Power supply ③ Power supply unit
- ④ HART modem

Legend

U _B	Operating voltage
U _S	Input terminal voltage
R _B	Maximum permissible load for power supply unit (e.g. indicator)
R	Maximum permissible load for output circuit; is determined by power supply unit
	Functional earth

Cables

Maximum cable length 1500 m, AWG 24 twisted and shielded.

Power supply / current output

Terminals 31 / 32 serve both as a connection for the power supply and as a 4 ... 20 mA current output for the transmitter. The current output is also used for HART communication.

Power supply

Terminals	31 / 32
Voltage	Standard: 10 ... 46 V DC Explosion-proof design: 10 ... 30 V DC.
Residual ripple	
Power consumption	< 1 W

Current output

Terminals	31 / 32
Output	4 ... 20 mA, can be configured to 21 ... 23 mA for an alarm (in accordance with NAMUR NE43)
Load	Minimum > 250 Ω , maximum 1500 Ω (for I at alarm = 23.0 mA)
Temperature effect	$\leq 8 \mu A/K$
Power consumption	< 1 W

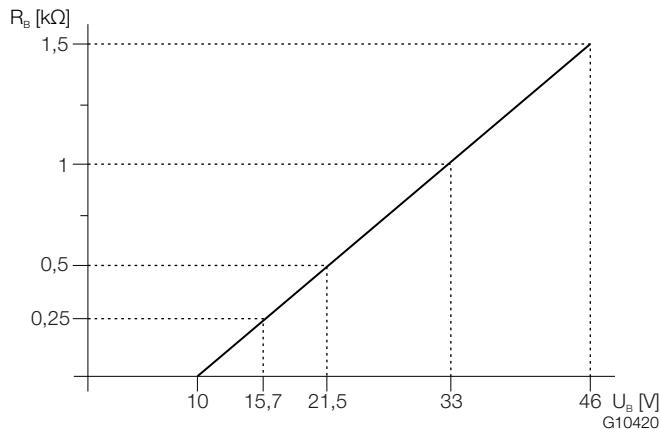

Fig. 25: Load diagram of the current output

7.5.4 HART output

Model FAM54xE/Fx

Specifications

Terminals	31 / 32
Configuration	— Directly on the device — Using DAT200 Asset Vision Basic software and HART-DTM
Transmission	FSK modulation on current output 4 ... 20 mA in accordance with Bell 202 standard
Baud rate	1200 baud
Display	Logic 1: 1200 Hz Logic 0: 2200 Hz
Maximum signal amplitude	1.2 mA _{ss}
Load (R_B) at current output	250 ... 1500 Ω

See the separate interface description for detailed information.

System integration

In conjunction with the DTM (Device Type Manager) available for the device, the corresponding framework applications in accordance with FDT 0.98 or 1.2 (DAT200 Asset Vision Basic) can be used for communication (configuration, parameterization).

Other tool/system integrations (e.g., Emerson AMS/Siemens PCS7) are available on request.

The necessary DTMs and additional files can also be downloaded from www.abb.com/flow.

Programmable binary output

Terminals 41 / 42 are used as a primary programmable binary output. The pulse output, general alarm, min./max. alarm and general alarm functions, as well as "no function" can be configured using the software.

Binary output

Terminals	41 / 42
Output	— NAMUR contact (DIN 19234) or — Standard optoelectronic coupler ($U_H = 16 \dots 30$ V DC)
Switching behavior	Configurable as normally closed or normally open contacts
Internal resistance	With contact open > 10 k Ω
Switching current	Maximum 15 mA
Output voltage	Minimum U_s 2 V DC

Pulse output

Terminals	41 / 42
Pulse width	5 ... 256 ms, maximum 50 % of the period
Frequency f_{max}	Maximum 50 Hz

8 Commissioning

DANGER

Improper installation and commissioning of the device carries a risk of explosion.

For use in potentially explosive atmospheres, observe the information in chapter „Use in potentially explosive atmospheres according to ATEX and IECEx“ on page 7 and „Use in potentially explosive atmospheres in accordance with FM and cCSAus“ on page 18!

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

8.1 General information

The commissioning activities described here are performed after the device has been installed and electrically connected.

Bear in mind the following during commissioning:

- The power supply must be switched off.
- When using liquid measuring media, the piping must be vented carefully to avoid pressure shocks due to gas bubbles.
- When using gaseous measuring media, increase the flow pressure slowly.
- Vary the flow with help of adjustable valves (control valves) to protect the float from shock waves. Otherwise, the flowmeter may be damaged.
- If fast opening solenoid valves are used, pressure shocks on the float must be prevented by using suitable damping measures.

8.2 Switching on the power supply

The following points must be checked before commissioning the device:

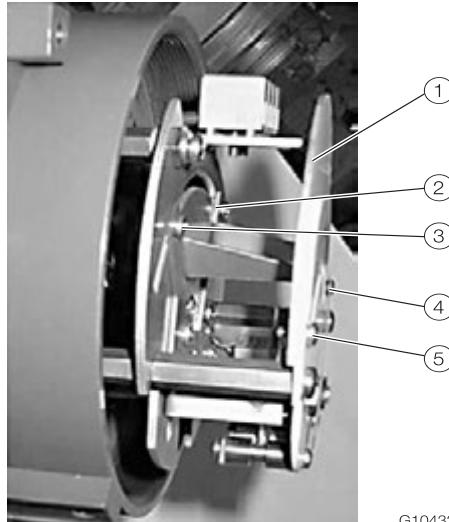

- The wiring must have been completed as described in the chapter „Electrical connections“ on page 36.
- The correct grounding of the sensor.
- The ambient conditions must meet the requirements set out in the technical data.
- The power supply must meet the requirements set out on the identification plate.

8.2.1 Inspection after switching on the power supply

The configuration of the measuring medium parameters (standard and operating density) must be checked after commissioning the device. The measuring medium parameters must be adapted to the measuring medium being used if necessary.

See chapter “Standard density” and “Operating density” menu“ on page 46.

8.3 Setting the alarm signaling unit

G10432

Fig. 26

1. Unscrew the housing cover.
2. Loosen screws (1) and remove cover plate (2).
2. Loosen screws (3) + (4).
3. Move the alarm signaling unit (5) into the desired position.
4. Tighten screws (3) + (4).
5. Replace cover plate 2 and tighten screws (1).
6. Screw on housing cover.

NOTE

For explosion proof apparatus, remove the safety locking device before opening the housing cover and reattach it after closing the housing!

8.4 Configuring the programmable output

The switch output of the transmitter is configured by default as a NAMUR contact.

The contact can also be configured as an optoelectronic coupler output.

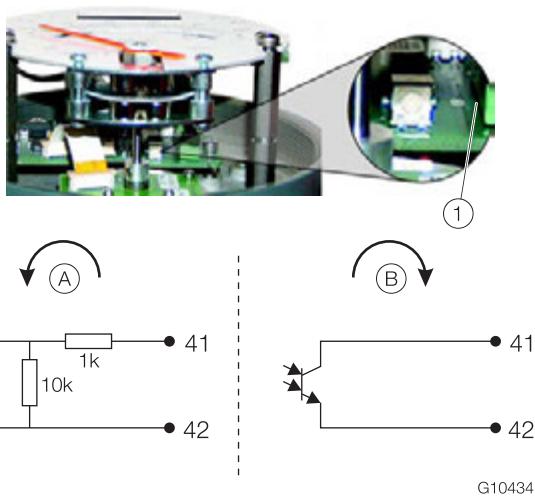

Fig. 27

- (A) Switch to left stop: NAMUR contact
- (B) Switch to right stop: optoelectronic coupler function
- (1) Rotary switch for output configuration

1. Unscrew the housing cover.
2. Bring rotary switch into the desired position.
3. Screw on housing cover.

NOTE

For explosion proof apparatus, remove the safety locking device when opening the housing cover and reattach it after closing the housing!

8.5 Operating instructions

Observe the following points when operating the device:

- Aggressive media may result in corrosion and abrasion of the parts that come into contact with the medium. As a result, pressurized media may escape prematurely.
- Wear to the flange gasket or process connection gaskets (e.g., aseptic threaded pipe connections, Tri-Clamp, etc.) may enable a pressurized medium to escape.
- When using internal flat gaskets, these can become embrittled through CIP/SIP processes.

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

9 Operation

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

9.1 Menu navigation

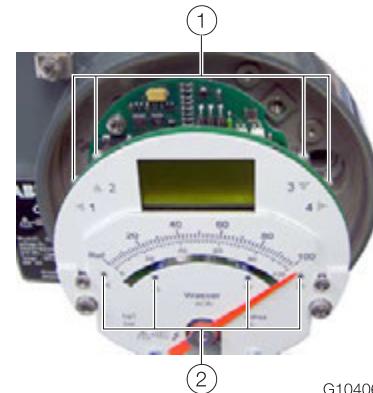

Fig. 28: LCD display

- (1) Operating buttons for menu navigation
- (2) Points for magnet stick operation
- (3) Menu name display
- (4) Menu number display
- (5) Marking to display the relative position within the menu
- (6) Display of the function of the ▲ and ▼ operating buttons

You can use the ▲ or ▼ operating buttons to browse through the menu or select a number or character within a parameter value.

Different functions can be assigned to the ◀ and ▶ operating buttons. The function that is currently assigned (6) is shown on the LCD display.

Operating button functions

◀	Meaning
Exit	Exit menu
Back	Go back one submenu
Cancel	Cancel parameter entry
Next	Select the next position for entering numerical and alphanumeric values

▶	Meaning
Select	Select submenu / parameter
Edit	Edit parameter
OK	Save parameter entered

Changing the user level

Before changing parameters, select the proper user level.

1. Press the □ button to jump to the Main Menu.
2. Use the ▲ or ▼ buttons to select the Prog.Level entry.
3. Press the □ button to jump to the Prog.Level.
4. Use the ▲ and ▼ buttons to select the desired user level and press ► (OK) to confirm.

You can now complete parameterization in accordance with the selected user level.

Magnet stick operation

The magnet stick provides an alternative means of parameterizing the device even when the housing cover is closed.

To execute the functions, hold the active side of the magnet stick against the corresponding areas on the LCD indicator.

9.1.1 User levels

The device features four user levels. The user levels are selected in the "Prog. level" menu.

The following user levels are available.

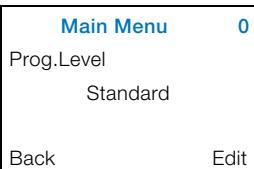

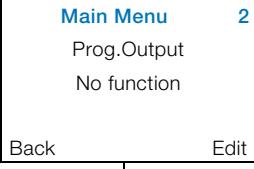

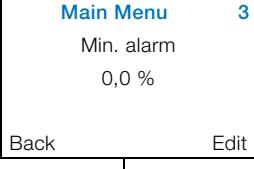

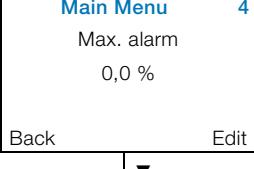

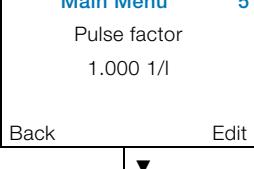

User level	Description
Standard	This user level is used for quick parameterization of the device. All of the customer-specific menus / parameters required for device operation can be configured here.
Specialist	In this user level, all menus / parameters are visible.
Service	The service menu is reserved exclusively for the after-sales-service of ABB Automation Products. It includes the default settings of the device. It can only be accessed with the service code. Changes may cause the device to display incorrect information.
Locked	In the "Specialist" user level, all menus / parameters of the "Standard" are visible, but cannot be edited. After an interruption of the power supply, this user level is active

9.2 Parameterization of the device

9.2.1 Parameter overview

i NOTE

This overview of parameters shows all the menus and parameters available on the device. Depending on the version and configuration of the device, not all of the menus and parameters may be visible in it.

Menu / parameter	Value range / Input type	Comments
 Main Menu 0 Prog.Level Standard Back Edit	Prog.Level 1 Standard Specialist Service Locked Cancel Ok	Standard Specialist Service Locked Use the ▲ and ▼ buttons to select the user level and press the ► button to confirm.

9.3 Description of menus and parameters

9.3.1 "Prog.Output"menu

In this menu, the programmable binary output (terminals 41 / 42) is parameterized .

The following settings are available:

Function	Description
Pulse output	Pulses with the parametrized pulse value (pulses / unit) are output
Max / Min alarm _ _	The contact is closed in the event of an alarm
Min / Max alarm / _	The contact is opened in the event of an alarm
General alarm _ _	The contact is closed in the event of an alarm
General alarm / _	The contact is opened in the event of an alarm

i NOTE

If the output is parameterized as a general alarm, the error states and min-max alarms are output cumulatively.

9.3.2 "Operating mode" menu

The device has been calculated and rated for a specific application.

The device can be adapted to a different, new application using the operating mode and the associated parameters, such as the operating density or the standard density of the measuring medium.

The device uses the new parameters to calculate its new maximum measuring range end value (Q_{max} Medium). The current position of the float is automatically converted into the correct flow value. It may be necessary to adapt the Q_{max} value.

9.3.3 "Standard density" and "Operating density" menu

Depending on the operating mode, the system requests the standard density or the operating density of the measuring medium.

The density of liquids always has to be stated in the operating condition.

Standard densities for a few selected gases:

Gas	Standard density [kg/m3]
Acetylene	1.172
Ammonia	0.771
Argon	1.780
Ethane	1.350
Ethylene	1.260
Butane	2.700
Natural gas	0.828
Carbon dioxide	1.970
Carbon monoxide	1.250
Air	1.290
Methane	0.717
Neon	0.890
Propane	2.020
Propylene	1.915
Oxygen	1.430
Nitrogen	1.250
Hydrogen	0.0899

To convert the standard (normal) density to the operating density, use the following formula for ideal gases (based on Gay-Lussac and Boyle-Mariotte):

Standard density (ρ_n) → to operating density (ρ) conversion

$$\rho = \rho_n \times \frac{1,013 + p}{1,013} \times \frac{273}{273 + T}$$

Legend

ρ	Operating density [kg/m3]
ρ_n	Standard density [kg/m3]
p	Operating pressure [bar]
T	Operating temperature [°C]

9.3.4 "Low flow cut off" menu

Input range: 1 ... 10 %

The low flow value is needed for the low flow cutoff.

If the measured flow falls below the set value, the measured value is set to zero, i.e. the current output indicates 4 mA and the flow count is interrupted.

For variable area flowmeters, this value should be set to 5% because of the physical conditions.

9.3.5 "Current output" menu

Configure the current output behavior for device alarms in the current output submenu.

The settings High and Low are available.

- If the setting is High, a value between 21 ... 23 mA can be set for the current output.
- If the setting is Low, a value between 3.0 ... 3.6 mA can be set for the current output.

i NOTE

A single "Error 3" (overshooting of the measuring range) always results in a high alarm, regardless of the setting!

The current output behavior follows the NAMUR recommendation NE43.

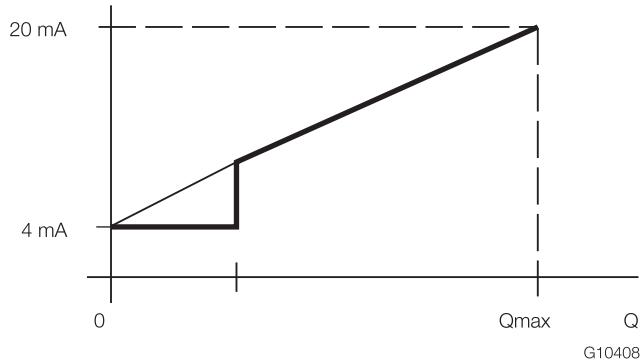

Fig. 29: Current output behavior

The measurement value output at the current output is as shown in the diagram:

Above the low flow, the current is a straight line that would have 4 mA at $Q = 0$ and 20 mA at $Q = Q_{max}$ operating mode. Because of the low flow cutoff, the flow rate is set below x% of Q_{max} or the low flow is set to 0, i.e. 4 mA.

9.3.6 "Function test" menu

Submenu	Adjustable values	Description
Iout	Numerical	A set point value for the current output can be predefined between 4 ... 20 mA. When the menu is quit, the current output immediately returns to the current flow value.
Simulation	Off	The simulation is switched off (flow mode)
	on	The simulation is active (simulation mode). Values between 0 ... 110 % can be simulated with the help of a submenu.
Int. database	confirm	The internal database of the transmitter (FRAM) is checked and confirmed with "OK".
Ext. database	confirm	The checksum of the transmitter software is checked manually and confirmed with "OK". The checksum is checked routinely every 30 seconds during operation. An incorrect result would result in Error 9.
Prog. Output	open	Switch output at terminals 41 / 42 open
	close	Switch output at terminals 41 / 42 closed
	5 Hz	Outputs a 5-Hz-signal at terminals 41 / 42
	100 Hz	Outputs a 100-Hz signal at terminals 41 / 42
HART transmission	confirm	The transmission can be executed at 1200 or 2200 Hz
HART reception	confirm	Shown when signals are received
Voltages	confirm	Shows the current voltage at the terminals.

9.3.7 "Totalizer" and "Overflow"

The number of counter overflows is indicated here. The maximum number of counter overflows is 65535.

The overflow counter also overflows thereafter and resets to 0. The total counter count can be calculated as follows:

Example:

Status of overflow counter: 12

Current counter status = 12345 m³

$$\begin{array}{rcl} 12 \times 10\,000\,000 & = & 120\,000 / 000 \text{ m}^3 \\ + & & 12\,345 \text{ m}^3 \\ \hline & = & 120\,012 / 345 \text{ m}^3 \end{array}$$

9.3.8 "Damping" menu

The response time of the measuring device can be set as desired using the Damping parameter.

Damping corresponds to a first-order low-pass filter.

Typical value 3 ... 5 s.

10 Diagnosis / error messages

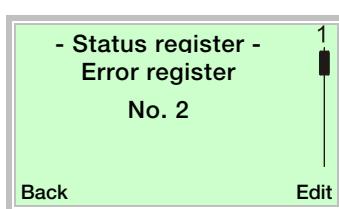

10.1 Calling up the error description

In accordance with NAMUR recommendation NE 107, a distinction is made between error messages and warnings. Errors and warnings are saved in the register.

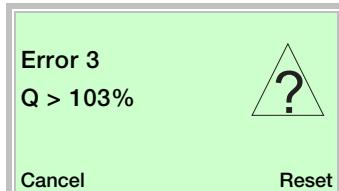

Errors directly affect the current output.

Warnings can be read via the HART-protocol and processed. Errors and warnings that have occurred can be called up by using the "Status register" menu. When the menu is opened, the number of errors and warnings is displayed. When the error (warning) register is called up, the type of warning or error is indicated.

1. Select the "Status register" menu in the main menu by using ▼ or ▲.
2. Confirm the selection with ►.

3. Open the first pending message with ►.
 - The message can be reset with ►.

4. Open the additional pending messages with ▼ or ▲.
 - The message can be reset with ►.

i NOTE

- Warning and error registers can be cleared on the "Standard" user level in order to be able to see when they occur again.
- On the "Specialist" user level, there is an additional "Mains interrupt" submenu, which saves the number of power outages. The power outage counter can only be reset by the ABB after-sales service.

10.2 Error messages

Message	NE 107 classification	Cause	Remedy
Error 1 Front End	Failure	Hardware error on the front-end board.	Please contact the service department.
Error 3 Q > 103%	Out of Spec	Overshoot of the device measuring range.	Reduce the flow rate, check the application.
Error 5a Int. database	Failure	A data loss has occurred. The device is reset to its factory or default settings.	The error is repaired in the device itself. Clear the error register and check the settings.
Error 5b Ext. database	Failure		
Error 6 Counter	Failure	Loss by the counter. The counter and the overflow counter are reset to 0.	Clear the error register and observe the situation.
Error 8 Voltage	Out of Spec	Terminal voltage too low (< 9.5 V).	Increase the voltage at the terminals (> 10 V).
Error 9 Checksum	Failure	The checksum of the software in the µ-processor differs from the stored checksum.	Please contact the service department.
Error 10 Hardware	Failure	Self-check functions have detected an internal HW-error.	Please contact the service department.
Error 12 Viscosity	Out of Spec	The viscosity entered for the fluid is too high in relation to the viscosity insensitivity number of the device.	Reduce the viscosity or have the device recalculated for a higher viscosity. Please contact the service department.
Warning 1 Simulation	Check function	The device is in simulation mode.	Quit simulation mode (off).

11 Maintenance

11.1 Safety instructions

DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

CAUTION

Risk of burns due to hot measuring media.

The device surface temperature may exceed 70 °C (158 °F), depending on the measuring medium temperature!

Before starting work on the device, make sure that it has cooled sufficiently.

NOTE

Damage to components!

The electronic components of the printed circuit board can be damaged by static electricity (observe ESD guidelines).

Make sure that the static electricity in your body is discharged before touching electronic components.

Repair and maintenance activities may only be performed by authorized customer service personnel.

When replacing or repairing individual components, use original spare parts.

Corrective maintenance work may only be performed by trained personnel.

- Before removing the device, depressurize it and any adjacent lines or containers.
- Check whether hazardous materials have been used as materials to be measured before opening the device. Residual amounts of hazardous material may still be present in the device and could escape when it is opened.

Within the scope of operator responsibility, check the following as part of a regular inspection:

- the pressure-carrying walls / lining of the pressure device
- the measurement-related function
- the leak tightness
- the wear (corrosion)

11.2 Cleaning

When cleaning the exterior of meters, make sure that the cleaning agent used does not corrode the housing surface and the seals.

To avoid static charge, a damp cloth must be used for cleaning.

11.3 Flowmeter sensor

Essentially no maintenance is required for the sensor.

The following items should be checked annually:

- Ambient conditions (air circulation, humidity),
- Seal integrity of the process connections,
- Cable entry points and cover screws,
- Operational reliability of the power supply feed, the lightning protection, and the station ground.

12 Repair

12.1 Safety instructions

⚠ DANGER

Danger of explosion if the device is operated with the transmitter housing open!

Before opening the transmitter housing, bear in mind the following:

- Check that a valid fire permit is available.
- Make sure that there is no explosion hazard.
- Before opening the device, switch off the power supply and wait for $t > 2$ minutes.

⚠ WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

⚠ CAUTION

Risk of burns due to hot measuring media.

The device surface temperature may exceed 70 °C (158 °F), depending on the measuring medium temperature!

Before starting work on the device, make sure that it has cooled sufficiently.

ℹ NOTE

Damage to components!

The electronic components of the printed circuit board can be damaged by static electricity (observe ESD guidelines).

Make sure that the static electricity in your body is discharged before touching electronic components.

Repair and maintenance activities may only be performed by authorized customer service personnel.

When replacing or repairing individual components, use original spare parts.

12.2 Replacing the analog indicator

If you are carrying out repair work or converting to a different indicator type, it is possible to replace entire indicator units. To make sure of obtaining traceable units that are in perfect working order, you can order them from ABB by specifying the original serial number.

Please note the following measures to be taken:

Provided	New	Conversion possible	Customer actions
FAM540, non-Ex	FAM540, Ex	No	—
FAM540, Ex	FAM540, Ex	yes	None
FAM540 A/B/C/D- Ex	FAM540 E/F-Ex	yes	Safety re-evaluation of measuring point due to different indicator model
FAM540 E/F-Ex	FAM540 A/B/C/D- Ex	yes	
AM54-Ex	FAM540, Ex	yes	Safety re-evaluation of measuring point due to new approval and, where applicable, different indicator model

Please observe the installation information provided in the operating instructions.

Depending on the application, operators must comply with relevant national installation specifications. (e.g. NEC, CEC, ATEX 137, IEC60079-14, etc.).

Installation / uninstallation of the analog indicator

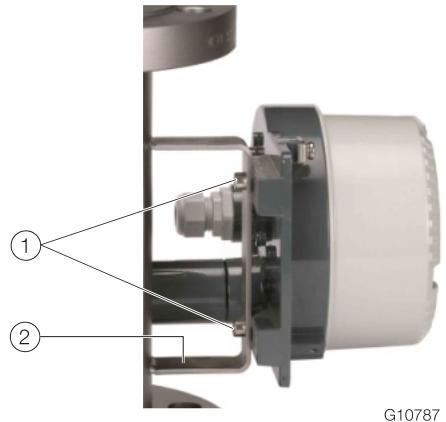

Fig. 30:

- (1) Hexagon socket screws (2) Mounting bracket

The analog indicator is fastened to the mounting bracket with two hexagon socket screws.

To facilitate the use of an analog indicator that is compatible with the meter tube, the bracket has a plate bearing the serial number.

The analog indicator is centered using 2 metal bushings that are permanently bonded to the indicator and must not be moved.

Dismounting

1. Detach hexagon socket screws.
2. Remove analog indicator.

Assembly

1. Install analog indicator, paying attention to proper centering of the metal bushings.
2. Tighten hexagon socket screws.

12.3 Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes. Fill out the return form (see the Appendix) and include this with the device.

According to the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes: All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 2 for nearest service location.

13 Recycling and disposal

13.1 Disposal

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:

- This product is not subject to WEEE Directive 2002/96/EC or relevant national laws (e.g. ElektroG in Germany).
- The product must be surrendered to a specialist recycling company. Do not use municipal garbage collection points. According to WEEE Directive 2002/96/EC, only products used in private applications may be disposed of at municipal garbage collection points.
- If it is not possible to dispose of old equipment properly, ABB Service can take receipt of and dispose of returns for a fee.

i NOTE

Products that are marked with this symbol may not be disposed of through municipal garbage collection points.

13.2 Information on ROHS Directive 2011/65/EC

The products provided by ABB Automation Products GmbH do not fall within the current scope of regulations on hazardous substances with restricted uses or the directive on waste electrical and electronic equipment according to ElektroG.

If the necessary components are available on the market at the right time, in the future these substances will no longer be used in new product development.

1 Safety instructions for repair work

ABB flowmeters are designed to be easy to repair thanks to uniform replacement parts and simple replacement of predefined parts.

However, if repair work is not carried out in accordance with the guidelines, this may result in malfunctioning of the device, causing serious injury to persons, and harm to the environment. This is especially true for safety-critical devices and those certified for use in explosion hazard environments.

Certifications will also lapse if the repairs were not carried out with the proper tool or by persons without adequate training. We therefore recommend all repair work on flowmeters be carried out by ABB service technicians.

As the manufacturer of the device, ABB cannot guarantee the necessary quality of the repair procedures if the work and/or parts exchange was not carried out by ABB.

The plant operator is responsible for all repairs carried out by the customer, plant operator, or third party. In this case, ABB will reject all responsibility for any improper device functionality, in particular all safety-related functions.

ABB does not assume any liability for the deterioration or loss of device performance, malfunctions, or damage arising from the above repair work or replacement. All liability for defects shall lapse when the replacement or repair work is not carried out by ABB.

If you are unsure about the repair process even if some or all replacement parts are available, please get in touch with ABB Service before beginning work.

Respect national and internal laws when carrying out repairs. In particular laws relating to certified flowmeters used in explosion hazard environments. Repair work which is carried out without following the legal requirements can result in the revocation of your operating permit.

For more information, go to <http://new.abb.com/service/repairs> or contact your local ABB Customer Service Center.

2 Name plate specifications for spare parts orders

The flowmeter version can be identified by referring to the name plate that is attached to the housing. When placing spare parts orders, always remember to state the order number as shown on the name plate.

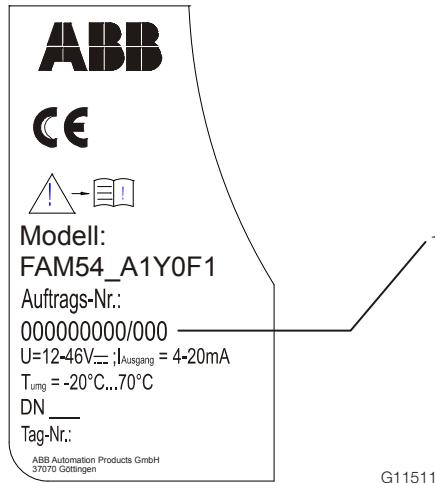

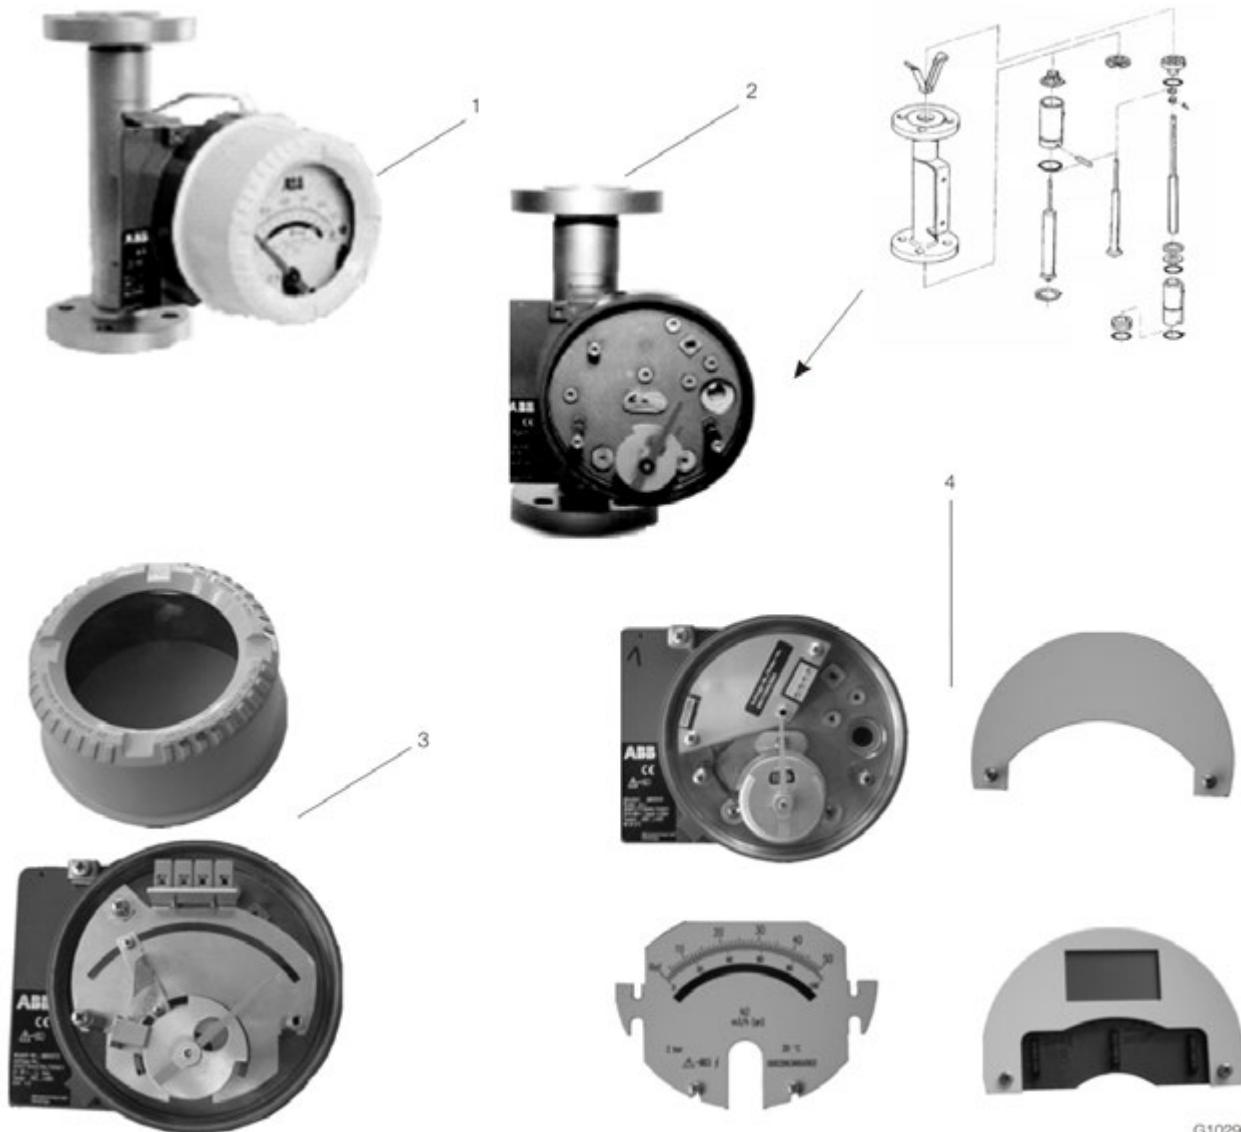

Fig. 1: Name Plate
1 Order number

3 Overview

i NOTICE

No spare are dispatched for devices with Ex-admittance. Reconstruction / repair only in Göttingen.
